>
> :-() (my wife when she heard how much it cost!!!)

I don't think that's true, I'm not positive but I have some brochures that
say that there was even a new update for standard ST Notator a while ago
(v3.16 or something). It wouldn't make much sense to totally replace Notator
with Logic since at this point their market is all Notator... BTW, is Logic
finished and available at retail yet? They were doing the Mac version
first, then the ST/TT/Falcon version, then eventually a Windblows version.
I have a pseudo-demo of the Mac version, and while it looks pretty, there
seems to be very little that isn't in ST Notator 3.1.

Ahhh the major reasons why people buy Intel platform.
(The word clone is over used and trite in my opinion since most "clones manufactures" don't really copy anything.)
1. There is more software out for it.
2. Everybody else has one (be it work or friends) or atlest thats the way it apears.

Thoes are the only reasons why I have one. Intel is far from the best.

>Ate> file are absolute paths starting with "/".

>I love zoo, but this is the absolute ultimate worst (enough
>superlatives?) thing that I have ever heard.

Well, what else can it do? It certainly can't store the drive
specifier.

> An absolute path
>starting with "/"??? This makes it unextractible on Unix boxes.

Not at all. Just use the `.' option to the `x' command, and absolute
path names are made relative to the current directory.

> Yes,
>sometimes I look at the docs at work before bringing it home.

Even easier: "zoo xp: neatprog readme.doc | less". The `p' extracts to
standard out, and the `:' stops it from creating the directories it
thinks it needs.

INSOFT-L on LISTSERV@CIS.VUTBR.CZ Internationalization of Software
Discussion List

Internationalization of software relates to two subjects:

1. Software that is written so a user can easily change the
language of the interface;

2. Versions of software, such as Czech WordPerfect, whose
interface language differs from the original product.

Topics discussed on this list include:

-- Techniques for developing new software

-- Techniques for converting existing software

-- Internationalization tools

-- Announcements of internationalized public domain software

-- Announcements of foreign-language versions of commercial
software

-- Calls for papers

-- Conference announcements

-- References to documentation related to the
internationalization of software

This list is moderated.

Went to Comdex/Toronto yesterday and stumbled across 'Microsoft Arcade' in
the MS booth. What it is is 5 games for Windows. The games are:
Battlezone
Missile Command
Asteroids
Tempest
Centipede
Apparently Atari worked with MS on this product and they are all faithful
to their respective originals. Great fun for work!

Well, that's an entirely subjective opinion, of course. I bought a PC
because I needed one for certain programming needs... but don't try to
convince me that I prefer DOS or Windows over other operating systems.
I _like_ my Ataris and I _enjoy_ using my Mac but my PC was purchased out
of necessity, most certainly NOT due to some misguided love affair.

What have you been smok'in?!!!! PC's are a horrible example of cludged together hardware! Lets not even mention DOS! The only way to make a PC tolerable is to put UNIX on one. People buy them cuz the other brands don't spend millions fooling people into it. Like Nintendo, HAHAHA!

1481. Harddisk drivers for Atari ST

Newsgroup: comp.sys.atari.st
Date: 1993-07-14 21:26:48 UTC
From: gbennett@friendly.es.com
Message-ID: <221tmo$499@cnn.sim.es.com>
Source record: 203506

I recently purchased a Gemulator board for my PC (Please don't flame me for owning a PC), anyway, I am trying to get the virtual hard disk to operate. I have tried using Atari's HDX software, and it will not recognise the drive. The Gemulator docs say that Atari drivers have problems with the Gemulator software and recommend Supra's drivers. Can anyone tell me where to locate the Supra dirvers (hopefully on the net). I would also appreciate it if anyone could direct me to a file explaining how to install a hard drive. I am sure I am doing it right, but who knows, it's not working now.

Thanks to anyone responding

Greg Bennett A.K.A. 'The Friendly User'

P.S. Does anyone know if a joystick 'emulator' exists; (the Gemulator does not support a joystick at this time)

Dear Antonis,

The first thing that you need is a computer. To connect a modem to your machine you will need a modem cable. Most of the times, RS232C is what you require. The modem that you will be using should respond to Hayes commands. Older models are somewhat awkward to handle and you must do all sorts of gymnastics to get them to work. If your friend uses a dial-up connection (this means, he has to first dial a number to connect to a service that connects him to Internet) then he should use VT100 or higher terminal emulations. If you have access to FTP then download a good terminal program for him to use.

Please try to ask specific questions and I will do my best to answer you. It is difficult to estimate the level of experience that you or your friend has. Feel free to E-mail me at wojci_g@pavo.concordia.ca. Take care guys!

Those are the reasons most people have them, I think. However, those
aren't the things I look for when I buy a computer. That's why I have an
Atari. It far surpasses clones in what I have a computer for.

I have a 486/33 sitting here right next to my TT. Guess which one is
being used? :)

I will say almost certainly no. The person who owned my ST before me
tried to connect one to his Mac without success. Perhaps the SM124
could be made into a VGA monitor though?

I don't know...

1488. how to get gcc working on 1040STF...

Newsgroup: comp.sys.atari.st
Date: 1993-07-15 02:27:09 UTC
From: lancer@wpi.WPI.EDU
Message-ID: <LANCER.93Jul15022709@wpi.WPI.EDU>
Source record: 203524

I've got a 1 meg, 1 drive (until I get a SCSI to go with my Link), 1040STF...

I FTPed the gcc binaries and two of the libraries from atari.archive, but can't get it working... Is there a FAQ for this?

Which binaries do I need? Which include files? How I tell gcc where the includes are on a floppy system?

I assumed that I would just need gcc.ttp and that I could call it from a ramdisk and insert the filename (ie: hello.c) as the parameters and it would give me a nice little a.out file, but it doesn't. Instead, it reads the file, thinks for a second, and exits. In gulam it reports exit cmd 1... Was I silly to think I could just run it and it would work?

please email or post. I read this group regularly...

thanks,
.s.

1490. Got my Falcon, now for some questions...

Newsgroup: comp.sys.atari.st
Date: 1993-07-15 03:08:32 UTC
From: azog@world.std.com
Message-ID: <CA6rE9.AFC@world.std.com>
Source record: 203527

Ok, so I picked up my new Falcon last Tuesday night, and have had about
a full day to play around, and some questions pop into mind...

Firstly. Is it just a phsycological (sp?) effect, or is the Falcon
a bit bigger than an ordinary ST? It seems that the keyboard is just
a little bit higher off my desk. Not that it matters to me, or will
effect the operations, but just curious.

The manual says the within the General CPX, the Blitter option may
or may not be preset. Well, there is no Blitter option here, just
the speaker off/on. Why is this? There *is* a blitter here in this
machine, yes? (more on this later). Again, not that it really matters,
I would just always leave it enabled. The TOS is marked 4.04.

I did run an old indexing program I had, and it reported a blitter,
but it also reported a 68000 (at 40MHz)...

Thats about it. All in all, I am pretty pleased, with some minor grumbles.
Like why did Atari use the damned 9 pin RS-232C instead of the 25 pin?
Why are there no pin signals on the DSP pinout?

Although we have had several people working as beta testers, we have yet to do any extensive testing with MIDI programs. Any programs which are "correctly" and "legally" written should work fine. A lot of effort has gone into making Geneva compatible as much as possible with existing software. Special flags can be set on a per application basis to try to smooth over rough spots where older applications may not get along with newer features.

As far as the serial port goes, this too depends heavily on how a program is written. We have had people using multiple copies of STalker on different ports with no difficulty.

Since the beta testing has been limited to a fairly small number of people up until now, there are a lot of specific programs that have yet to be tested. Once we have more information on how compatible various programs are, we will be happy to answer such questions. What I can say from my own experience is that I've yet to try a program which simply didn't work. A few have required setting one or more of Geneva's special compatibility flags, but they did work. Mostly, it has just been setting the program to single tasking mode, because it just isn't written to share the system. I have also already seen multiple examples of programs that worked under Geneva, but not under Multi-TOS.

] >are just the smartest and safest choice nowadays.
]

Sounds like you are going using the software as a judging point.
Taking the machine without software, and upgrade all machines to
the same capabilities, and it's not really a very good machine!
(With software, it's a pretty good machine, as there's lots of it,
and lots of it is good!)

I tried to get the latest AEO, but you zipped the file.

I tried two unzip programs and both of them said that it wasn't a zipped
file or it was compressed in another format.

What zip program did you use? I tried both that are in the archives...

Anyone else have luck?

From: ASI503@DJUKFA11.BITNET
Message-ID: <93196.085557ASI503@DJUKFA11.BITNET>
Source record: 203525

Well, one should choose the language suitable for a specific problem, that's certainly true! But there are other points that should be considered. For example: Ease of maintaining large pieces of software, possibility of writing clearly structured programs and so on. From that point of view, I don't think that any kind of FORTRAN is a good choice.

I guess the main reason why many scientists use FORTRAN is that large software libraries exist for whatever problem you have to solve numerically. If one does not have to use such a library, it is certainly better to program in C or ...

I too am a scientist, but I would be VERY reluctant "to think in Fortran". I write programs for the simulation of superconducting devices, which requires the integration of lots of ordinary and partial differential equations. I am using C and feel no need to use any other language.

>but can't get it working... Is there a FAQ for this?
>
>Which binaries do I need? Which include files? How I tell gcc where
>the includes are on a floppy system?
>
Your system is too small to run gcc. You will need at least 2 meg of ram
to run it.
a setup for gcc contains (at least) the files
gcc.ttp compiler driver
gcc-cpp.ttp preprocessor
gcc-cc1.ttp the compiler
gcc-as.ttp the assembler
gcc-ld.ttp the linker

These files are the bare minimum of binaries.
As libraries and include files you could try mntincXX.zoo and mntolbXX.zoo,
where XX is a version number (I think the most recent version is 32).

Anyone who has upgraded a mac would probably _give_ you 256K SIMMs.
Often they just throw them away. I have a whole box of them at work
that are useless, worthless, and I don't know why I am hanging on to
them, but it seems such a waste to throw out perfectly good memory.
If I can ever find a Falcon for sale, I might get one of these boards
and pop some 256Ks in until I can afford 4M jobs.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

How much difference will a software accelerator such as warp 9 or NVDI make on a Mega 4? Is either of these two better than the other?

Also would an accelerator board be any better considering the extra price? Can you combine the two?

Are there any problems with software compatibility?
(I have heard that Timeworks 2, which I use, does not work with NVDI)

Any idea of prices and places to buy/have fitted these in the UK?

Sorry about all the questions,
Phil
(E-mail pd@mbuc.bio.cam.ac.uk) Send replies to this address instead of the one at the top of the message

Oh yes, one more thing. Why is it a single A4 page (from Timeworks) takes about 20 minutes to print on a Canon BJ10e (in BJ mode, I haven't tried epson mode yet).
Will a accelerator help with this or is it just the combination of program+printer?

Source record: 203542
Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other

I have the following for sale:

1040 ST $100
Has 68000 in socket, internal clock(needs battery)
No problems

SC1224 color monitor $175
Original (circa1985) no problems

Gemini 10X printer $50
No problems

Would prefer it to go as a package.
ST with monitor and printer for $300. Shipping not include. No
reasonable offer refused.

Have the following software for the ST:

LaserC $40
LaserC Debugger $20 ($5 with LaserC)
OSS Personal Pascal (v2) $10
Tacklebox ST (v2) $20
VDI,AES etc bindings for Personal Pascal
Printmaster $10
Regent Base (database) $15
EZ Calc (spreadsheet) $10
GFA Draft $10
Printmaster $8
Copy II ST $5
COLR Object editor $3
Disk Doctor $5
All Start mag Disks $20

Games:

Shanghai $10
Battle Chess $15
Leather Goddess of Phobos $8
Winnie the Pooh $8
Simcity $15

Books:

C-Manship Complete w/disk $15
Abacus Tricks and Tips $8
Abacus Internals $8

Programmer's Guide to Gem $10

Again shipping not included. Software can be had for a greatly reduced price if purchased with a packaged computer deal above. Or group several items for a better price.

NO REASONABLE OFFER REFUSED.

WRONG. The first two examples will store RELATIVE path information, starting
at (and not including) foobar.

>I love zoo, but this is the absolute ultimate worst (enough
>superlatives?) thing that I have ever heard. An absolute path
>starting with "/"??? This makes it unextractible on Unix boxes. Yes,

You didn't read them carefully enough. As others have pointed out, you can
use the "." option to extract absolute paths as relative. Besides that, the
":" and "/" options allow a variety of possibilities to deal with
subdirectories while extracting.

From: gbennett@friendly.es.com
Message-ID: <223ta2$dit@cnn.sim.es.com>
Source record: 203541

Just in case nobody could read my previous post. I am looking for anyone that has been able to get the virtual hard drive to work with the Gemulator. The Gemulator docs say that the Supra Hard drive drivers are recommended, but I am not sure where I can obtain them. I have tried to use Atari's HDX drivers but they do not recognize the virtual drive. I would really appreciate any help; including any help on setting up a hard drive for the ST (I think that I am doing it right, but I have been known to make mistakes in the past)

Also I was wondering if ther exists a utility to allow the keyboard or mouse to emulate a joystick. I didn't get the Gemulator to play games, but a few that require a joystick will run. Unfortunately, the Gemulator doesn't support a joystick (Bummer).

P.S. Does anyone know what happened to hazzard.tos on the umich archive. Is it available anywhere else?

I've written very structured FORTRAN programs. Most languages provide
the required operators to structure programs. It is up to the
programmers to write programs in a structured, maintainable fashion.

> I guess the main reason why many scientists use FORTRAN is that large
> software libraries exist for whatever problem you have to solve numerically.
> If one does not have to use such a library, it is certainly better to program
> in C or ...

Nope, don't think so. On many architectures, FORTRAN programs run
faster (many computer architectures provide direct assembly forms for
many operators in FORTRAN, which is not quite so true of C).
Preallocation of memory is also faster than runtime allocation in C on
many systems. NOTE: I said many systems - your mileage may vary.
Also, most optimization work has been done on FORTRAN, with
optimization work on C only happening relatively recently....

Still don't see why C is better for numerically intensive work.

> I too am a scientist, but I would be VERY reluctant "to think in Fortran".
> I write programs for the simulation of superconducting devices, which
> requires the integration of lots of ordinary and partial differential
> equations. I am using C and feel no need to use any other language.

No sweat - you can think any way you like. I know some people that
would use lisp to solve the class of problems you are suggesting, and,
with the right hardware and software, that solution would work well.

I think people should get away from religious wars and accept that
there is on general tool to do it all - BTW, have you ever used any of
the specialized simulation languages?

Have fun! - Bob

>starting with "/"??? This makes it unextractible on Unix boxes. Yes,
>sometimes I look at the docs at work before bringing it home.

I dont understand your post. Unix paths on ALL Unix machines use the
/ character. That makes the files extractable! It is MS-DOS and some
others that user \. And MS-DOS in particular has a problem with /
because it is reserved for options (switches). A Unix box can use \ for
other things even though it is used for "quoting" or special characters.

Anyhow, dont flame me if I misinterpreted. But if zoo uses / for
paths, that is the correct way to do it if you want to be similar to
unix.

|>(v3.16 or something). It wouldn't make much sense to totally replace Notator
|>with Logic since at this point their market is all Notator...

V3.16 provides some extra score-printing symbols (guitar chord names etc)
and not a lot else. Certainly no bug fixes for arrange mode and a few others
that annoy me a lot. Also it is apparently NOT going to be supported on the
Falcon, you need to get Logic for that.

Apparently though you can run Notator with a Logic dongle.

BTW, is Logic
|>finished and available at retail yet? They were doing the Mac version
|>first, then the ST/TT/Falcon version, then eventually a Windblows version.
|>I have a pseudo-demo of the Mac version, and while it looks pretty, there
|>seems to be very little that isn't in ST Notator 3.1.
|>
I have only seen Mac version reviewed, some dealers are advertising ST version

in UK but then they wer advertising ADAT and Falcon's years before they shipped!

I had some mail from Canada (thans Kevin Thorpe) saying he had had and upgrade offer thru the post. I have not had anything yet in the UK (I am registered Notator user). However given it took months for my 3.16 upgrade to come thru...

1516. More recent C for ST?

Newsgroup: comp.sys.atari.st
Date: 1993-07-15 18:20:29 UTC
From: cse0080@desire.wright.edu
Message-ID: <1993Jul15.132029.11296@desire.wright.edu>
Source record: 203549

Does anyone know if someone picked up after Mark Williams after they dropped (or so I've heard) their version of a C compiler for the ST? I have an early copy and would like to know if there are later/better around. I have been out of the Atari scene for about 5-6 years, so anything in the interim would be news to me.

Thanks,
Karl C. Hansen

In article <1993Jul15.124027.27144@crc.ac.uk>, naffara@crc.ac.uk (Dr. N.A. Affara) writes:
>How much difference will a software accelerator such as warp 9 or NVDI make
>on a Mega 4? Is either of these two better than the other?

BIG difference. Both programs speed up the display by about a factor of
4. NVDI is better and faster in my opinion and according to various
benchmarks. NVDI is more compatible with graphics cards and overscan
modes.

>
>Also would an accelerator board be any better considering the extra price?

An accelerator will speed up the CPU, so everything will be faster, not
only the display.

>Can you combine the two?

Yes, that's exactly what I have done.

>
>Are there any problems with software compatibility?
>(I have heard that Timeworks 2, which I use, does not work with NVDI)

Mostly not. Timeworks is not compatible with NVDI's GDOS emulation. This
can be switched off which solves the problem and you can use you standard
GDOS instead. The screen acceleration part works fine with Timeworks as
far as I know.

>
>Any idea of prices and places to buy/have fitted these in the UK?

NVDI is available from System Solutions 081-693 3355 for about 50UKP,
they also have accelerator boards starting at 140ukp. Fitting the board
requires some soldering on a MegaST.

>Oh yes, one more thing. Why is it a single A4 page (from Timeworks) takes about
>20 minutes to print on a Canon BJ10e (in BJ mode, I haven't tried epson mode
>yet).
>Will a accelerator help with this or is it just the combination of
>program+printer?

An accelerator would help somewhat, have you tried FASTPRNT (part of the
Fontkit Plus pack from ST Club) ? This makes a big difference.

Well I hope there isn't another announcement for the sake of whoever leaked the information last time. I'm sure that the big run-up in ATC 2 days before the last announcement got the SEC's attention. It would be rather foolish for the party(ies) invloved to do it again (expecially so soon).

Not that I would be heartbroken...I still have my 5000 shares. :)

Chris

1521. GAMES AND MODEM FOR SALE********

Newsgroup: comp.sys.atari.st
Date: 1993-07-15 19:35:41 UTC
From: beave@hardy.u.washington.edu
Message-ID: <224bid$mo6@news.u.washington.edu>
Source record: 203550

As per someones request I am informing you now that I am selling these items from the U S of A in dollars. Chris if you are out there I will gladly hold these original items for you if your response to this posting comes soon. I lost your number and I really want to get rid of this stuff.

I have the following games for sale and all include docs unless otherwise marked by an *:

Phantasie III
Into the Eagle's Nest
Obliterator
Moebius
Gauntlet II
RoadRaider
Police Quest II --I also have the cheat book for this one
The King of Chicago
TotalECLIPSE
Tau Ceti
Alternate Reality THE CITY
Space Quest III
Weird Dreams
Willow

All games are $4.00 each unless you buy 3 or more then they become $3.00.

I also have a Goldstar 1200 Baud modem that works great if you have a need for that kind of thing. I would part with that for $12.00. Chris: I can give you the same stuff as before for $21 now. Sorry for the problems. Request what you will all by E-mail and please include your address and I will send the stuff out immediately. BTW, I will cover shipping in case you were wondering.

Source record: 203601

I bought Civilization for the ST a month ago. (released 2 years after the PC version; kind of reminds me of how long it took Bard's Tale to come to the ST.) Anyways, just finished conquering the world the first time, and the game died doing the history replay.

Is there a patch to fix this?
Better yet, is there an executable with the fixes already applied which I can ftp from somewhere?

As a side comment, this is an amazingly playable game. I haven't enjoyed playing on the ST this much since Llamatron!

>Gribnif, and they confirmed that Geneva does indeed support an
>"unlimited" number of windows.

There's an application the Germans are probably most familiar with. It's called WINNI.PRG. It's basically a test program that draws billions and billions of windows. One of the first times I ran it, I told it to stop drawing windows at around 100 or so. :-)

Just now, while editing this in STalker, I pulled up NeoDesk, found WINNI.PRG, and had it draw over 100 windows. It started at window 4 because I had STalker and a couple of windows in NeoDesk open.

>So, Ed, is there anything more you can tell us about it, having
>had some extensive experience with it?

What do you want to know? It's a very cool program. An article in AEO might be forthcoming.

One neat feature is tear-off menus. You can actually tear a menu off the menu bar and have the commands in a window, instead of always having to select the menu.

From: aa399@cleveland.Freenet.Edu
Message-ID: <224rt8$eup@usenet.INS.CWRU.Edu>
Source record: 203606

This is to all Atari developers....

How do you feel about Atari not releasing the Falcon030 dealer listing
to Atari developers?

Does it matter to you that you do not know where your products are being sold?

Or possible places where your products can be sold?

I received a message from someone at Atari that told me developers do not need
a dealer list since most of them sell their stuff through distributors.

I was attempting to get Atari to reverse this decision.

>>
>Yes, like how does it cope with MIDI, Cubase, serial port, etc.

I don't do any MIDI or use Cubase. The serial port works fine with
STalker and Aladdin. With STalker, I consistently get 1500-1700cps.

If Cubase doesn't work in multitasking, it should work fine in
singletasking mode. Basically, Gevena can run programs in singletasking
mode, and if you want to switch to the multitasking ones, you just click
on one of their names under the Desk menu, in the Task Manager window, or
the Applications menu, which is created when you tear off the Desk menu.
When you click on the multitasking app, the singletasking app goes asleep.
Of course, when you're using the singletasking app, the multitasking ones
are asleep.

>You can buy the beta version for $20, then upgrade later. I sent some
>info to atari.archive. Look at GEBETA.TXT, GENEVA.TXT, and I think
>GEDESC.TXT. I think those are the correct filenames.

Not to contradict Ed, since I really appreciate him taking the time to answer all these questions, but the Beta release costs $50, not $20.

It is only available to registered North American (USA and Canada) NeoDesk 3 users. Shipping to US destinations is $3, and to Canada its $4. This price gets you the July 14th Beta release, which comes with documentation on disk. When the commercial version is ready (projected date Sept 1), you get a free upgrade, and the real printed documentation. The Beta version also includes a patch to NeoDesk version 3.04, which is necessary for compatibility with Geneva. (And is only available for this purpose, the next general release of NeoDesk will be NeoDesk 4, around the beginning of October.)

The only feature that is totally missing from the Geneva Beta is that it does not yet work with MiNT, and there are several other features that are still very "rough". However, it is still extremely useful, and very solid. You get full multitasking for GEM applications, plus 3D buttons, a new file selector, tear off menus, etc, etc...

- Bob

From: plastika@terpsi.csi.forth.gr
Message-ID: <plastika.742796655@news.forth.gr>
Source record: 203614

Hello.
I posted a letter the day before, asking for advice about connecting a modem
to an atari. Here are some more info.
I use a serial cable made by the seller of the modem. Tested on a PC it was
Ok. Don't think that's the problem.
I have tried 3 different terminal emulators with the same problem.
Everything I should get from the modem isn't coming to the screen. When I
issue the atdp.... command, I hear the beeps it shoyld play when connecting, but get no
answer on my screen.
When I say at(something), I get no OK, no nothing.
I use 2400,N,8,1 to connect.
The cable, the modem, the telephone line shoyld be OK, since I hear the modem
connecting to the server I want.
Shoyld I do something on The Atari? What could be wrong?
Another idea: should any special pins of the serial cable be joined (I have
seen and they are connected all that the atari manual says in its appendix,
except the earth ground). The in pin is connected to the in pin and the out pin to the out.

Any ideas will be appreciated. My only last thought is there is a problem
with the Atari's serial port's in pin.

Please remember that I am not an Atari user, I am just helping a friend. I
use a modem on my PC though.

Thanks,
Antonis -desperate- Plevrakis,
Crete, Greece.

>> Still I don't see why C is better for numerically intense work ...

Okay, I really did not intend to participate in the holy war against Fortran/
pro C. Rather the opposite! Personally I prefer the syntax and the look of
C programs. Of course it is possible to write well structured, well documented
programs in Fortran as well as horrible cryptic code in C. But still I think
that C (or Pascal or ...) is more convinient for structured programming.

Some systems may provide better performance for Fortran written programs.
Because of the long history of Fortran and its hardware platforms this is
understandable. My point was, that one has to make a good compromise between
speed and ease of programming and personal likes/dislikes of the look and feel
of a certain language. As you stated, the speed of C programs depends
enormously on the optimizing quality of the compiler, so speed might not
be the problem if one chooses the right one (compare Pure C and GNU C on
the ATARI. Almost one order of magnitude in some cases!).

Have fun !

The Supra stuff in on there BBS (503-967-2444) but there driver dose not
support partions above 32 megs...

You don't have to be validated to get it, and at 14.4

and also its on GEnie...

1542. Problems with 1st Word Plus - Help wanted.

Newsgroup: comp.sys.atari.st
Date: 1993-07-16 10:48:55 UTC
From: arw@ukc.ac.uk
Message-ID: <5268@eagle.ukc.ac.uk>
Source record: 203618
Cross-posted to: ukc.micro,comp.sys.atari.st

I'm having problems using 1st word plus with a Star LC24-200 printer and wondered if anyone had experienced similar problems.
The printer emulates a Epsom LQ860, and i have the print driver for that printer with 1st word+. Upon printing out however, the printer seems to miss lines every now and again when printing out the graphic image files. These don't seem to be random (ie, does the same misprint each time, so the printer should be fine).

Telling 1st word+ that I have an LX (9 pin) printer attached produces output okay (but shrinks the graphics and probebly loses resolution).

If anyone has any ideas at all as to what could be causing this, please e-mail me!

Thanks you,
adam whitham

Try Lattice C 5.5x - ANSI, full integrated environment with make which is
compatible with Turbo C makefiles, resource editor, librarian and all the
usual bits. Alas, no source level debugger but one is available
from 3rd parties (X-Debug).

Huh? Are you talking about the IBM announcement? If so, Atari was sitting
at just over 2 for a while before that announcement, and didn't shoot up until
the day AFTER the announcement. Likewise with the original Jaguar press
release. It was somewhere between 1 and 1 1/2 until the day AFTER the press
release.

I'm positive that there are freely available complex libraries for C++;
with a "complex" class, you could go:

```
// Dunno what cexp() does in FORTRAN! It's bee too long, thank god! :-)
complex f = a * b * sqrt(e);
```

C++ takes all the work out of it, if somebody else has already written
the class for you.

>Better yet, is there an executable with the fixes already applied
>which I can ftp from somewhere?

Well, I don't know of a patch but I did get around it - when it
crashes it should mention the name of a graphics file. This file
doesn't exist, simply re-copy another graphics file (with a similar
name) into the directory, renaming to the name of the missing file.
You'll get slight graphics corruption but it shouldn't crash.

>As a side comment, this is an amazingly playable game. I haven't

Try C++. operator overloading. Many C++ compilers have complex classes
that come with it. If yours doesn't, it it VERY easy to write one...

When's the last time you heard of anyone MAKING money on Atari? I picked up
1500 shares the day of the IBM announcement (when it was selling at 2-7/8) and
put in a sell order at 5. I then forgot about it, until I looked up the price
last night at 5-1/4. Oops, says I. I called my broker this morning, and he
confirmed, it was sold yesterday at 5. But he told me, never look back.
In any case, not a bad profit for a few weeks of Atari watching :-)

>How do you feel about Atari not releasing the Falcon030 dealer listing
>to Atari developers?

Len, by and large, your source was correct in that most Atari devs sell their products through distributors and retail to the public, not direct to dealers. The fact is that most dealers prefer to order all their inventory from a single distributor rather than make several smaller orders to individual developers. This way they only have to deal with one company, they write one check, and generally pay a lower-per-unit freight cost.

However... developers would _still_ like to have this dealer listing simply so they could send brochures and other info to these dealers so they could be sure the dealers were _aware_ of the products they have to offer when it comes time to place an order through their distributor (of which there are only 2 in the U.S., BTW). Why Atari chooses not to release this info is beyond my comprehension. Perhaps because the list is embarassingly short???

This system is not too small for gcc - I did it on my own identical system. Put the preprocessor and header files on one floppy, the compiler and driver on another and the assembler, linker and libraries on a third. It is also an idea to get hold of the gcc manual page (or other documentation) as gcc is a complicated piece of software.

[Specifics Deleted To Save Disc Space And Keep SysAdmin Happy]

Isn't that why GEM uses *.RSC files? All of the operator interface
is kept separately from the program so that all you need to do is
edit the *.RSC file and ship the edited file with the *same* program.
That reduces the issue to "where can I find someone who can trans-
late all these messages?"

Or am I _missing_ something, here?

Wrongo! If you peruse the zoo docs (they are rather long though), you'll
see the marvellous '.' command modifier which forces extracted files to
be relative to the current directory. I use this all the time. So you can
say

zoo x.// archive

and even absolute paths starting with '/' will be rooted at your current dir.

Glad you put the 'smiley' on that comment ... I know that most of the folks who work with the atari.archive site take a lot of time and trouble to see that what gets put up there gets moved appropriately within 24 hours.

What does that delay get you? You can be sure that the archive tests 'ok' using one of the UNIX-based versions of the archive program (these are located in the ../Archivers/Unix directory for those of you who have UNIX boxes and want the utilities). The software uploads get moved to mostly-appropriate subdirectories. An index entry is made for the software, so you don't HAVE to download a file without knowing what the heck it might be. You also have some idea which files are more recent (hint: they're in the Newitems directory, or listed in the '0new0, 0new1, 0new2, etc.' files...)

As for fighting to get to atari.archive, it's a problem that's becoming general every day. One only needs to look at the wuarchive.wustl.edu site (which is also a mirror site for atari.archive, by the by), or the ftp.cica.indiana.edu site (where you can pick up Windows-related stuff), to see that it is a common problem to get into FTP sites.

Keep smiling!

Before putting a foot into the C vs Fortran arguments - everyone should first consider the customer being discussed - the Fortran application user.

Most scientists (but not including Computer Scientists) learned Fortran somewhere along the way. Most of their applications are written in Fortran. That offers them a certain amount of "standard"ness which helps their efforts when they find that the application they are using does not quite do what they want. They know how to change it to get exactly what they need - precisely because the application is written in Fortran. (assuming of course, that the source is available.)

The same does not apply to C and scientists (excluding Computer Scientists)

I'm not trying to defend either - just recognizing a fact of life - the customer and all of their needs. Wayne Booth

... and if you trust that the class library was written correctly. :)

Most of the 'good' class libraries are commercial --- the earlier Rogue Wave
libraries were more or less freely available, but the newer versions definitely
cost money (as an example). I've heard much about problems with some of the
class libraries out there ... we're currently rewriting thousands of lines of
FORTRAN-based simulation code for C++.

Source record: 203643

Ok, I have had my Falcon for a few days. My Dr. T's DTP scoring program works, but my Hybrid Arts doesn't. I find sometimes you have to have an ST video emulation mode for ST software to work. All of the stuff I wrote using Mark Williams C works. I haven't tried MWC to compile, but when I leave the resource editor, it bombs. Word Perfect seems to drop some funny charactars when I do spell checking, but it doesnt crash. The Atari Works might be better, for one thing, I can scale fonts on my lowly Epson FX in a way that Word Perfect couldn't. I am looking to get a HP 550C or 500C color printer anyway.

Haven't tried any of the DSP / Audio stuff. I am told Cubase is going to come out with a hell of a program for it, so I might wait for that. and bag the Hybrid Arts stuff. Hybrid Arts is out of business? I know some other company took over there stuff. I have SMPTE GOLD and GEN EDIT 1.1.

Does anybody know what Cubase is up to?

I probably will replace my SC1224 monitor. It doesn't work, or rather, flickers when you go to interlace mode, and Atari's Direct to Hard Disk recorder wants interlaced video. Why, I don't know.

I just received an offer from Dr. T to upgrade to KCS Omega II. This is a MIDI sequencer event editing package that now includes MIDI faders and MIDI tape controller modules. It incorporates the original TIGER program with some enhancements.

Has anyone had experience with this package either in the original form or in the new release? The upgrade is $99. Is it worth it.

Thanks...

You don't have to wait a long time. It's still much faster to load a
packed program from a hard drive than to load it *unpacked* from a
floppy. Try it.

<FLAME_ON>

In article <93196.085557ASI503@DJUKFA11.BITNET>, ASI503@DJUKFA11.BITNET (Erik Sodtke) writes:
|> Well, one should choose the language suitable for a specific problem, that's
|> certainly true! But there are other points that should be considered. For
|> example: Ease of maintaining large pieces of software, possibility of writing
|> clearly structured programs and so on. From that point of view, I don't think
|> that any kind of FORTRAN is a good choice.

It really depends on your coding style; it is certainly possible to write structured Fortran programs, since subroutines and functions have been around for some time. Comments in source code, whether in Fortran or C are what make code easy to maintain. Style is more important than language; these issues are red herrings.

|> I guess the main reason why many scientists use FORTRAN is that large
|> software libraries exist for whatever problem you have to solve numerically.

Besides software library issues, a major issue is speed; although some would claim otherwise, Fortran generally produces more efficient code for
numerically intensive programs. Some of the elegant data structures available in C can induce some overhead. Too much structure, i.e. many calls to subprocedures will also slow things down. Another reason many scientists use Fortran is because it's easier to learn; not everyone needs
to understand de-referencing a pointer to a variable record structure.

|> I too am a scientist, but I would be VERY reluctant "to think in Fortran".

When I said "I think in Fortran", I meant I can look at a mathematical expression and write a Fortran program using it without refering to any manuals. Fortran means FORmula TRANslation, after all.

|> I write programs for the simulation of superconducting devices, which
|> requires the integration of lots of ordinary and partial differential

|> equations. I am using C and feel no need to use any other language.

I am involved in maintaining and developing a program with over 200,000 lines of Fortran code for molecular simulation; there's a lot of integration involved, and speed (efficient f.p. computation) is a major issue. Most major commercial and academic programs in this resarch area
are in Fortran; only graphics code gets written in C, largely due to the
C chauvinism rampant in the Athena project (X windows development).

<FLAME_OFF>

Still, in most instances, the choice of languages is a personal one, and should depend on how well the language features match your needs, especially if you are starting from scratch. It may also depend on which language you learned first, or which compilers are the best or most widely available on the chosen hardware. Frankly, if speed isn't an issue, I'd rather use APL, which is also available for the Atari ST line; now there's a REAL computer language...

1583. Programming Help

Newsgroup: comp.sys.atari.st
Date: 1993-07-17 05:57:23 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <CAAoJn.6pq@sdf.lonestar.org>
Source record: 203682
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a few questions. I would like sone info on using the STE DMA sound. How do I access the micro-wire interface, and I remember something about the MFP seeing a change in the mono detect line at the end of a sample or something like that. I would also like some info on programming the MFP. Preferablly in C!

Why should we use shel_write()? Last I knew it killed the calling program. And that really sucks for 90% of the reasons why I'd ever call Pexec(). In fact there is no way to make shel_write load a program and load it concurrently either, like in MiNT. shel_write knows that some programs are text and some are GEM, will it use the TOSRUN pipe to execute programs?

I'm writing a transfer ACC and I'd like to it to multitask cooperatively on old systems, and pre-emptively with MiNT. I was planning on using Tfork() to do the actual transfer since that way it gets executed in the background pre-emptively under MiNT (and I can just sit in an evnt_multi call during the transfer), and will execute as a function call without MiNT. The problem with this is that I need to call evnt_multi() while the transfer is going if there is no MiNT. Can I latch onto some interrupt and make an evnt_multi() call from a timer interrupt? If so, how? I'd rather not just use evnt_multi after every block as that would slow down high speed transfers ALOT, and would eat CPU time for lunch at slow speeds. I would like to call evnt_multi() once per second. Also, how are semaphores used? MintLib, in its mentioning of Tfork() says that semaphores must be used for things like malloc(). Exactly what calls must be "semaphor"'d and how is this done?

Does MiNT 1.04 still use the blocking Pfork()? If so, should I assume that there is no magical fix in Mintlib 33 either and so fork() is still blocking?

Thanks a bunch for all your help, please send replies as E-Mail to :
evanlang@sdf.lonestar.org

1584. EE Times: "Atari Jaguar an IBM Animal"

Newsgroup: comp.sys.atari.st
Date: 1993-07-17 06:33:50 UTC
From: rjung@netcom.com
Message-ID: <rjungCAAq8F.7r4@netcom.com>

For those of us who don't read the EE TIMES, here's the Jaguar/Atari/IBM article that's provided a good dose of net.news.fodder for the last few weeks...

==========

The following article was published in the July 5, 1993 issue of Electronic Engineering Times. Permission to upload the text of this article was granted from CMP publications by Ms. Martha Rosaril.

(I thought the Atari community would like to read this
-- Greg Matthijetz, G.MATTHIJETZ)

"Atari Jaguar an IBM animal"

by Junko Yoshida
Sunnyvale, Calif.

Atari Corp. will score a new level of video-game performance this fall with the introduction of Jaguar, a 64-bit RISC-based system offering real-time 3-D shaded surfaces with texture mapping.

The $200 system, able to tap into the growing network of cable and telephone video services, will take videogames into a graphics realm once the province of midrange 3-D workstatins. In yet a further departure, the system will be built by IBM Corp.

Jaguar, billed as an interactive multimedia system, is based on an Atari-designed proprietary 64-bit RISC processor and its proprietary digital signal processors. The cartridge-based system features 24-bit true color graphics, shaded 3-D polygons and real-time texture mapping.

Atari claims that Jaguar offers four times the processing power of the current 16-bit videogames from Sega and Nintendo, and believes it is even more powerful than the coming 32-bit ARM CPU-based machine from 3DO Co. "If a spaceship goes around a moon, or a person walking on a street turns on the next corner, every object, every detail in such scenes is reproduced in shaded 3-D images with texture. It's truly amazing stuff," said Atari president Sam Tramiel.

--Dense ASIC's--
The system's graphics performance is compared by the company to that of the 3-D engines in midrange Unix workstations. And like those egines, Jaguar is based on advanced, very dense digital ASIC's.

Jaguar's core consists of two chip sets, one holding the 64-bit RISC processor and the other containing DSP hardware. "But the partitioning between the two chip sets is ambiguous." said Richard Miller, vice president of research and development at Atari, as the two share some functions. The two sets apparently pack a whole range of components, including controllers, video processors and encoders, leaving outside the core only "a very small amount of TTLs and DRAMs," said Miller. They were designed at an Atari facility in England, said Tramiel.

The 64-bit RISC processor is capable of processing video data at a high rate, handling various video effects as well as full-motion video compression on its own, Miller claimed.

--Lots of bandwith--
Atari would not disclose any more about the core ASICs, such as gate counts or data bandwidth, but Miller pointed out that Atari engineers had to concentrate most of their design efforts on bus bandwidth. "Graphics eats a lot of bus bandwidth. What's available today for other 64-bit processors such as PowerPC is only just enough for what we want to do," he said. "What we designed is right up on the level of expensive 64-bit processors."

To meet its cost goals, Atari had to push ASIC technology to the limit. The chip sets will be manufactured by "one of the top four silicon vendors in the world" using the "smallest geometry" available, said Miller. It is believed that with Jaguar Atari has become one of the early customers for a major Japanese 0.5-micron ASIC process, bt the company would not confirm this.

Clearly, manufacturing volume is essential to the Jaguar plan. The company intends to introduce an add-on PC card featuring the company's proprietary 64-bit RISC processor, said Tramiel. "It could also help minimize the cost of our chip sets," he said.

Atari is also considering licensing the chip set to other silicon vendors, but has not determined any details yet, said Tramiel.

The future holds more integration. But before working on the ultimate, a system on a chip, the next step for Atari's engineering team is to shrink what is currently a set of rather large custom chips further, reducing the whole system to "one processor, one DRAM, one ROM and one custom chip," said Miller. The company is looking at both synchronous DRAMs and Rambus DRAMs for future use, "but we are waiting to see some of the standards issues get settled first," he noted.

Miller does have a technological wish list. "First," he said, "we'd love to have 0.3-micron process technology as soon as possible for custom IC's. Second, we'd like to see some form of synchronous DRAMs appear as a standard commodity DRAM, and, naturally, a very high bus bandwidth to produce higher video persormance. The existing improvements for faster bus interfaces so far have been very

disappointing for us. Lastly, I'd love to play the Atari Jaguar system on a 10 X 10-foot display. I'm waiting for a very low cost, low power, large-screen-size display, using probably not an active matrix but FED-type technology."

In the long run, Jaguar is designed not just as a cartridge-based game machine. It will use a 32-bit expansions port to connect to cable and telephone networks, and a digital signal processing port for modem usage and connection to digital audio peripherals.

This I/O structure reflects Time Warner's 25 percent stake in Atari. "In the course of our product development, we've had frequent discussions with Time Warner. It has set the direction for our machine to have cable and telephone connections," said Leonard Tramiel, vice president of operating systems.

The company designed and built a 16-bit prototype home-entertainment machine two years ago, said Sam Tramiel, but scrapped the plan in favor of a grand attempt to leapfrog the 16-bit systems that were then coming onto the market. But then Atari engineers started to look for enabling technology, "there were no RISC processors and no DSP's that fulfilled our requirements, especially at our cost," said Miller. Atari's design team even had to develop its own HDL simulation tools, he said.

"People tend to forget that, unlike business users, comsumers do have much higher expectations in video quality, speed and cost," Miller said. "In order to match that demand, we had to really push the technological envelope, driving the chip counts down, designing the system to be highly manufacturable and depending on the smallest geometry prcess technology."

--IBM the OEM--
Atari will also push the envelope in another way, turning its back on traditiional East Asian manufacturing sites and calling on IBM to build Jaguar. IBM, working with a 30-month contract worth $500 million, will be responsible for component sourcing, quality testing, console assembly, packaging and distribution, and will build the system at its Charlotte, N.C., facility. The motherboard will come from an IBM-approved manufacturer, said Herbert Watkins, director of application solutions manufacturing at IBM Charlotte.

For IBM, producing the Atari Jaguar system makes it for the first time a major OEM for highly cost-competitive, mass consumer-electronics products, Watkins noted.

"To manufacture one of the most sophisticated game machines in the world, we needed someone who understood a high-volume, fast digital machine," said Miller. "IBM was a natural choice."

According to IBM, the prototypes of the Atari Jaguar system will come out in July, ramp-up models in August and mass-productions versions in September. The system will be available first on a limited basis

in the fall in New York and San Francisco areas. A national rollout
is scheduled for next year.

>Does anyone know if someone picked up after Mark Williams after they dropped
>(or so I've heard) their version of a C compiler for the ST? I have an early
>copy and would like to know if there are later/better around. I have been out
>of the Atari scene for about 5-6 years, so anything in the interim would be
>news to me.

No-one directly picked up from MW though there are some other newer C compilers. In the commercial area the main two are Lattice C from HiSoft which is a very complete system. Also available is Pure C from Germany which used to be Turbo C. In the free software area the port of GCC the GNU C Compiler, is pretty strong (if you have the memory and HD), and Sozobon C is about the only other competition (there are two different releases, the proper Sozobon release and also a port to run better as a GEM application call Heat 'n Serve).

Hope this helps.

Cheers,

1587. FALCON NVDI!!

Newsgroup: comp.sys.atari.st
Date: 1993-07-17 07:42:05 UTC
From: ac382@Freenet.carleton.ca
Message-ID: <CAAtE6.CMq@freenet.carleton.ca>
Source record: 203667

I was wondering where I would have to go to in Canada to get the
Falcon version of NVDI? I just got my Falcon today; I love the TOS 2.04
desktop and all the video modes but when running MTOS the screen redraws
are a tad slow in the 256/TC modes.
I have had no problems whatsoever with the falcon so far and it was
very nice to be able to take the computer home, hook it up to my IBM ps2
VGA monitor, and boom!! there is the desktop, and all sorts of goodies on
the Hard Disk (84 MB) all running under tos 2.04. If anyone from ATARI is
reading (there must be) : GOOD JOB!!
maybee a tad late but nevertheless a job well done.

Every piece of software from my ST
library has performed flawlesly(deluxe paint, jpeg decoders...)
Devpac3 is awesome!!!
True paint is VERY nice and fast and if Ishar and Transartica are any
indication of what Falcon games are going to be like then Falcon owners
are in for a very nice surprise..!! The sound capabilities of the beast
are truly incredible. And the machine is still extremely fast, even with
what some of the Amiga posters called the 'crippeled 16 bit ST ram'.
If you have the money by all means go to your local Atari dealer and
order/buy one. You will not be disappointed!

Jack

That's Cubase on the Mac. On the Falcon it uses the built in hardware
to achieve multichanel direct to HD sampling. Not so expensive!

Your initial reaction may also be that it is slow. BUt my experience
is that it is not any slower than a stock 8MHz ST and that running
additional programs under it doesn't slow it down even more. The
most glaring slow down seems to be in mouse responses.

Keep in mind how much memory you need on other platforms to do serious
multi-tasking... Two meg overhead isn't unreasonable compared to
Windoze on a peecee, which requires 8 meg and 30 megs of your hard drive.

Bob_BobR_Retelle@cup.portal.com writes:

>MIke, where does the new memory upgrade fit in the Falcon..? Does it
>replace the original sockets, or does it go somewhere else..?

Well, now that I've seen how it installs, I'm impressed. The old board (rectangular) comes out and the new board replaces it on the same pins. What happens is that that new board extends perpendicular into a small (but large enough...) space between the hard drive and the floppy mech. and the SIMMs stand vertically between the two drives. Nice design.

Now, for the part that DIDN'T impress me: It didn't work. Put in the 4meg SIMMs and lock up the computer. Not a blink. Figuring the board may be defective, we took a close look and found the thing to APPEAR to be entirely hand soldered, and several SIMM socket pins had not been soldered at all. We opened a second one, tried it. Same result. Dead. Zip. Nada. We tried re-soldering every pin to no avail. We tried 256K SIMMs just to see if we had some bad 4Meg SIMMs, and we did indeed get the computer to boot. Looked like it was running properly but the screen was munged beyond hope. You could see that the computer was working, but video interference was hopelessly extreme. We decided not to try it with 1Meg SIMMs. Instead, we called the manufacturer who insisted that every board is tested before shipping. (Wonder how the unsoldered pins worked at the shop, but not in our store...) So, at his request, we sent the devices back to them WITH OUR 4 MEG SIMMs for testing. Here's hoping we see the things returned sometime this century...

No need for me to wait for someone to GIVE me 256K SIMMs, I have a
stack of them too. My point is, what's the use of having a 1Meg
Falcon? I don't even want a 1Meg ST, to tell the truth, but a
1Meg Falcon would be useless.

I have seen ICDBOOT 6.1.4 work on both a Falcon and a Link, and it
performed flawlessly. My guess is that you have a munged disk or
some corrupted files... My suggestion is that you talk to ICD.

1597. Re: STuff 4 sale

Newsgroup: comp.sys.atari.st
Date: 1993-07-17 16:04:55 UTC
From: randyh@sad.hp.com
Message-ID: <CABGo8.Cs9@srgenprp.sr.hp.com>
Source record: 203679

All right, so no one one bit, so here are the new reduced prices in US dollars.
~~~~~~
FOR SALE:

ST mono monitor. Works fine. Expanded the screen for larger
viewing area. $70.00

ST single-sided floppy disk. $15.00

Avatex 1200 baud modem. $10.00

STAR NX1000 color printer. Extra Ribbon. $65.00
This is 3 years old but looks like new. I will also
include some print utilities for it if you have an ST.

Make an offer.

Buyer pays shipping.

Randy Hosler

Source record: 203683

On this subject, any chance of distributing a _smaller_ version of GEM-View!? (e.g. without the sample pictures and un-necessary stuff....) 600k+ is pretty large for what ends up taking up about 250k of disk space!

] >] about you, but I want my programs to load NOW, not load and then wait
] >] long time while it unpacks.
] >
] >Who said anything about Hard-Drive?
]
] You don't have to wait a long time. It's still much faster to load a
] packed program from a hard drive than to load it *unpacked* from a
] floppy. Try it.

That's pretty obvious! Any programs I use over about 50k in size I
give the treatment with PFX-Pack, as it's fast and gives pretty good
compression! It saves huge amounts of space! (Especially with some
of these 300k+ programs that pack down to around 100k!)

1601. Atari system for sale...

Newsgroup: comp.sys.atari.st
Date: 1993-07-17 22:07:41 UTC
From: sachlebe@sumax.seattleu.edu
Message-ID: <229t7dINNidj@sumax.seattleu.edu>
Source record: 203685

Well I hate to do it but it's time to put up my trusty Atari equipment
software, and books for sale. This is a very trustworthy system. All
components work like they are supposed to. Damn, I'm gonna miss this
system but I need the money for college tuition.

HARDWARE

Atari 520st w/2.5 meg and TOS 1.4
Real Time clock Cartridge
Atari SM124 Mono and SM1435 color Monitors
Monitor switch box
Atari Megafile 30 Hard disk
Jin mouse and Atari mouse
External generic double sided disk drive-720k
Avatex 1200 hc modem
Star 2400c modem

SOFTWARE

Silent Service
Sundog
Starglider II
Falcon w/ operation Firefight
Gunship
GFA Basic 2.0,3.0,3.5
Stalker 3
1st Word Plus
Pha$ar
VIP Professional
Multidesk Deluxe
Degas Elite
Timeworks Desktop Publisher ST + clip art disk
Neodesk 3
Universal Item Selector ver 3.3
G+ Plus by Codehead
Turbo ST
Flash 1.2
Write 90
Regent Base Relational database
ATARI DEVELOPERS KIT W/DISKS & MANUALS

lots and lots of START disks and various magazine disks
GFA basic programming books by Michtron(some good ones here)

I really would prefer to sell this all in one piece but if the
offer is high enough and it doesn't kill the value of the rest
of the package we'll see what we can do. EVERYTHING FOR $600.00.

Respond by e-mail to sachlebe@seattle.edu or by phone at (206) 328-5096.

I have cross posted this to a couple mac groups as well as the
atari group... I just got my Spectre GCR up and running. For you mac
people, the GCR is a hardware/software mac plus emulator for the atari
ST. I working in White Knight right now!
I am looking for an appropriate driver so that I can print to
my non-postscript ROland LP110 (Panasonic 4450/55) which has HP
Laser Jet emulation (or Epson). I would prefer a proper 300dpi LJ
driver but if epson is all I can get... can you please tell me which
site might have soemthing like this?

Thanks,
brett maraldo

1606. Blue Ridge Atarifest `93

Newsgroup: comp.sys.atari.st
Date: 1993-07-18 14:09:09 UTC
From: dawinic@eos.ncsu.edu
Message-ID: <1993Jul18.140909.18804@ncsu.edu>
Source record: 203690

Here's the latest Press Release for the show in Asheville:

BLUE RIDGE ATARIFEST '93
Press Release - July 17, 1993

FOR IMMEDIATE DISTRIBUTION

The Blue Ridge Atari Computer Enthusiasts (BRACE) and Computer STudio invite you to participate in the fourth annual Blue Ridge AtariFest on Saturday, July 24 and Sunday July 25, 1993. The show will take place in the Courtyard Shop area of Westgate Shopping Center in Asheville, North Carolina (Home of Computer STudio).

Our confirmed exhibitors include (Alphabetical Listing):

Atari Corp/Applied Audio Marketing . Atari's Southeast Regional Representatives will be on hand to let you know what's going on in the Atari world, especially here in the Southest U.S.

Accusoft-ST ..... PD/Shareware Software (Desktop Publishing Clip Art Libraries)

Barefoot Software ..... Professional MIDI Software applications (SMPTETrack, EditTrack Platinum, GenEdit, EZ Score Plus, etc.)

Binary Ink ..... David St Martin will discuss his own desktop publishing business and conduct informative seminars on "Marketing Your DTP Skills" and "Newsletter Desktop Publishing".

Codehead Technologies ..... Productivity software & enhancements (G+Plus, MultiDesk Deluxe, HotWire, CodeHead Utilities, Warp 9, Calligrapher, MaxiFile, Lookit & Popit, Avant Vector, MegaPaint, TOS Extension Card, etc.)

Computer STudio ..... Visit a 'real' Atari Dealership in the mall (Atari computer systems, software and

accessories)

DMC Publishing ..... Desktop Publishing System
Solultions (Calamus/SL, PKS
Write, Outline Art, Invision
Elite, tms Cranach Studio, etc.)

GEnieLamp/GEnie ..... Telecommunications and
Electronic Publishing

Gribnif Software ..... Utilities and Productivity
Software applications (NeoDesk,
STalker, STeno, XBoot, CardFile,
Convector Professional,
Arabesque Professional, XBoot,
Crazy Dots, etc.)

JV Enterprises ..... Developers of low-cost
license-ware software and games.

Lexicor Software ..... Professional animation and
rendering software (Prism Paint,
Phoenix Render, Meridian, etc.)

MajicSoft ..... Entertainment Software (Dropix
ST, Cyberdroid, Awari, Asalto,
Excalabur, Moons of Sol, etc.)

Missionware Software ..... (Flash II, lottODDS, Printer
Initializer, etc.)

STReport Online Magazine ..... Weekly Electronic Online
magazine. Current events in
the Atari marketplace.

Showtimes are 10am - 6pm on Saturday, and noon-5pm on Sunday.
Seminar sessions will be scheduled throughout the show.

A SWAP ROOM will also be available for use by anyone who has any
personally owned Atari related hardware or software they no longer
want or need and would like to sell (software sales are restricted
to packages containing ORIGINAL program disks only -- no shareware
or copies of software will be allowed to be sold in the swap room).
Tables will be available for $5 for half a day; three sessions are
available: 10am-2pm & 2pm-6pm on Saturday, and Noon-5pm on Sunday.
Tables may be reserved by E-mail (C.ALLEN17) or calling Cliff Allen
at (704) 251-0201.

Since this year's show coincides with Asheville's annual Bele Chere
Street Festival, we are not having a Saturday evening banquet, but
are instead encouraging guests to hop the shuttle bus at the front
entrance of the mall and spend Saturday evening downtown enjoying
the outdoor festivities (live entertainment, food booths of all
types, dancing, etc.).

Advance registration is only $3; or $4 at the door. Door prize winners will be selected from registered guests (you need not be present at the time of the drawing to win). Advance registration checks should made out to "COMPUTER STUDIO" and mailed to:

Computer STudio
Westgate Shopping Center
40 Westgate Parkway - Suite D
Asheville, NC 28806

For additional information, please contact either:

1607. Geneva Multitasking system for the Atari line of computers

Newsgroup: comp.sys.atari.st
Date: 1993-07-18 15:48:36 UTC
From: garth@splunge.uucp
Message-ID: <1993Jul18.154836.15373@splunge.uucp>
Source record: 203691

For those of you who expressed interest, here is the Real-Time
Conference from CompuServe concerning GENEVA, the new multitasking
operating system for the Atari line of computers from Gribnif
Software in the United States. Enjoy!

****

(3-1,Brad [sysop]) Maybe with just four of us here...
(3-1,Brad [sysop]) we don't have to worry about formal protocol...
(3-2,Rick @ Gribnif) True.
(3-1,Brad [sysop]) if it gets more crowded, we can move into it then...
(3-1,Brad [sysop]) OK with everybody?
;;[2] Rick @ Gribnif - Yep!
(3-2,Rick @ Gribnif) Sounds good.
(3-4,Rob Rasmussen) Sure

(3-1,Brad [sysop]) OK...
(3-1,Brad [sysop]) Celeste and Rob, this is Rick Flashman ...
(3-1,Brad [sysop]) of Gribnif software, as you know <g>...
(3-1,Brad [sysop]) who's going to talk a bit about GENEVA...
(3-1,Brad [sysop]) and answer any questions we may have...
(3-1,Brad [sysop]) Rick, would you like to make an opening
introductory-type little speech? <g>
(3-2,Rick @ Gribnif) Sure.

(3-2,Rick @ Gribnif) Geneva is our newest program for the Atari.
It is a Multitasking Application Environment.
For those more familiar with the Atari
operating system, Geneve is a complete
replacement of the "AES".
Geneva works on all Atari computers and only
requires less than 120k of memory. We are
considering an optional cartridge port version,
that will require 0k.
I can add lots, of I'd be mostly repeating the
press release. Why don't we let it
go from here, and see how the conversation
takes us.
(3-1,Brad [sysop]) OK... I have a couple of questions...
but will defer first to Rob or Celeste.
Any questions, guys?

(3-3,celeste moran) multitasking do you resolutions
(3-2,Rick @ Gribnif) Celeste, do you mean if you can have different
resolutions at once?
(3-3,celeste moran) yes, I don't have falcon yet

(3-2,Rick @ Gribnif) It works in all resolutions. However, it cannot
display different resolutions at the same time.
Not even Windows can do that, that's a hardware
limitation.

(3-1,Brad [sysop]) Rob?
(3-4,Rob Rasmussen) Does it work with MIDI applications?

(3-2,Rick @ Gribnif) It theory yes. However, since so many MIDI
programs don't work with anything (buggy
code) we are not sure how it works with all MIDI
programs out there. We are releasing
a major beta release today that will help answer
that. Never underestimate the ability of a MIDI
programmer to create software that refuses to work
with other programs (grin).

(3-1,Brad [sysop]) Will GENEVA work on all ST-or-later machines...
(3-1,Brad [sysop]) and all TOS versions?

(3-2,Rick @ Gribnif) Yes. I personally run Geneva on a TOS 1.4
Stacy 4. We have tested it on a 512K machine
with TOS 1.0.

(3-1,Brad [sysop]) How does it fit in with MultiTOS?
(3-4,Rob Rasmussen) Would it slow down an 8 mhz ST?
(3-2,Rick @ Gribnif) Brad - That's a complex question, let me answer
Rob first.
(3-1,Brad [sysop]) OK

(3-2,Rick @ Gribnif) Rob - The speed loss in Geneva is minimal.
I have some speed tests I uploaded to the
Gribnif section in Atari Vendors. Basically,
you lose about 2% overhead. The speed slowdown
for multiple programs is dependent on
that program. But it is VERY similar to the
speed slowdown you get when running desk
accessories.
(If you haven't noticed, each additional desk
accessory steals between 2-5% of your machine's
speed).

(3-1,Brad [sysop]) I didn't know that...
so if you're running six of them, your machine is
30% slwer?
(3-2,Rick @ Gribnif) Not really...because most accessories have a
very small event loop. Sometimes, though, one
accessory can slow you down lots more than others.
(3-1,Brad [sysop]) So about MultiTOS...
is it similar to GENEVA, or does one run GENEVA
within MultiTOS?
(3-2,Rick @ Gribnif) What we know as "MultiTOS" is actually several

products in one. First you have the new AES 4.0,
which is what gives you the 3D buttons, secondary
drop-down menus, enhanced alerts, etc.
AES 4.0 is also included in the Falcon, without
the rest of MultiTOS. However, AES 4.0 does not
offer any multitasking, unlimited accessories, etc.
MultiTOS also includes MiNT. An enhancement to
TOS that allows for true multitasking.
Put them both together, and you have what is
known as MultiTOS. A new version of the AES
capable (thanks to MiNT) of multitasking GEM and
TOS applications.
(3-1,Brad [sysop]) So AES is like a new desktop?
(3-2,Rick @ Gribnif) No, the "desktop" is technically a separate part
of the OS.
(3-1,Brad [sysop]) OK...
(3-4,Rob Rasmussen) I thought GEM was the desktop?
(3-2,Rick @ Gribnif) No, let me rewind a little.
(3-2,Rick @ Gribnif) TOS = The underlying portion (like MS-DOS on a
PC) that runs basic programs.
AES = Portion of GEM that handles running GEM
programs, desk accessories,
menus, drop-downs, buttons, alerts, etc.
VDI = Portion of GEM that handles drawing to the
screen, etc.
Desktop = A separate GEM application that allows
for file management and program lauching.
Geneva replaces the AES.
It is fully AES 4.0 compatible, so it has all
the new features. Plus, it lets you run any
programs that "requires" AES 4.0 on any machine.
Also, unlike the Atari AES, Geneva can multitask
unlimited GEM applications and load/unload
unlimited desk accessories.
(3-4,Rob Rasmussen) What about non-GEM prgs - TTPs, etc?
(3-2,Rick @ Gribnif) Since we do not replace TOS, those are
technically unnafacted.
HOWEVER...
We add several enhancements: Our TOS programs
run in a GEM window, when our TOS programs stop
at a prompt waiting for user input your regain
control of your system (poor man's multitasking),
and...if you add the freeware or commercial
version of MiNT, you *can* Multitask TOS
(TOS,TTP) programs.
(3-2,Rick @ Gribnif) If you already own a MultiTOS, there are several
reasons why you would still prefer Geneva:
1. You can replace Atari's AES with ours, adding
many new features.
2. Ours is faster.

3. Ours lets you use standard screen accellerators.
(Warp 9, NVDI, etc)
4. You can remove MiNT, and multitask GEM
applications with minimal speed loss.

(3-4,Rob Rasmussen) I had wondered about desk accs...
they are a crude multitasking on the ST, but with
your program, would DA's even be needed?
(3-2,Rick @ Gribnif) You have unlimited desk accessories (load and
unload on the fly).
They are needed, because there are so many out
there. But technically, no. Geneva always makes
very little difference between them. You can
double-click on either to run them. <grin>
(3-1,Brad [sysop]) The press release talks about multi- and single-
tasking programs...
I'm not sure what the difference is.
(3-2,Rick @ Gribnif) Single tasking simply means that other programs
are temporarily suspended (windows closed) until
that singletasking program you are
running either quits or it itself is suspended.
(3-4,Rob Rasmussen) Sounds great!
(3-2,Rick @ Gribnif) This is needed for programs that are not
multitasking compatible, such as the old Flash or
the old Degas.
(3-1,Brad [sysop]) Two of my favorites!
(3-4,Rob Rasmussen) <--uses both
(3-2,Rick @ Gribnif) In that case, Geneva acts as a switcher. However,
you can sleep those singletasking applications at
any time, and get full multitasking.
You also, STILL have access to all the other
Geneva features, such
as unlimited desk accessories, desk accessory
loading/unloading, tear-off menus.

(3-1,Brad [sysop]) I have Flash 1.6... where does that stand?
(3-2,Rick @ Gribnif) Flash 1.x = old flash
(3-1,Brad [sysop]) Right.
(3-2,Rick @ Gribnif) You actually don't notice that much. Visually
it is not that different if
(3-2,Rick @ Gribnif) a background programs is running or sleeping.
Unless you are running
(3-2,Rick @ Gribnif) a compiler or rendering program in the background.
(3-1,Brad [sysop]) so that means, for example...
(3-1,Brad [sysop]) that I can't be using Flash online, and jump to...
(3-1,Brad [sysop]) a word-processor during an online session?
(3-2,Rick @ Gribnif) Right. You can still switch, but you might
lose information coming over the modem.
(3-1,Brad [sysop]) I see.
(3-2,Rick @ Gribnif) Flash was just written that way. If you use the
new Flash, STalker, etc. then you have no problem.

(3-1,Brad [sysop]) I have a question about desktops...
(3-2,Rick @ Gribnif) Shoot.
(3-1,Brad [sysop]) OK...
(3-1,Brad [sysop]) the press release says that the ROM desktop is not
compatible...
(3-2,Rick @ Gribnif) Right. The ROM desktop isn't even MultiTOS
compatible.
(3-2,Rick @ Gribnif) (MultiTOS ships with its own disk loaded copy
of a desktop.)
(3-1,Brad [sysop]) Can you use GENEVA f you don't have any alternative
desktops?
(3-2,Rick @ Gribnif) You can, you just can't copy files, etc. without
one. Though I've seen some good PD accessories
that handle file management pretty good.
Actually, one of our beta testers said the
shareware Terradesk works fine.
Though I prefer NeoDesk...<grin>...

(3-4,Rob Rasmussen) I have a lot of prgs in my auto folder, including
ones that take up a lot of memory. Does GENEVA
not effect those and only applications that have
been loaded, up and running?
(3-2,Rick @ Gribnif) I still use all the same AUTO folder programs as
before. Any specific ones you are worried about?
(3-4,Rob Rasmussen) Shadow ram disk, foldr150, cache, print buffer,
Warp 9, Hotwire, etc.
(3-2,Rick @ Gribnif) Those should all work fine, as far as I know.
By not replacing TOS, those type of programs are
not really affected. Hotwire is a special case,
let me explain. Hotwire probably works great.
But when run from the AUTO folder, it is
designed to hook into the built-in ROM desktop,
which we don't load. So, you never see it. But
if you run Hotwire as a regular shell (as you
can), it should work fine. HOWEVER...
Hotwire has yet to be upgraded to be multitasking
(MultiTOS) compatible.
That means that it can only launch things in
"singletasking" mode.
We've given the Codeheads a copy of Geneva.
Though the changes needed are identical to the
changes needed to make it work with MultiTOS.
(Actually, the changes for Geneva are LESS than
what you need for MultiTOS).

(3-1,Brad [sysop]) Rick...
(3-1,Brad [sysop]) since GENEVA can be activated from the desktop,
what do you mean by you "don't load" the ROM
desktop? <still confused about desktops!>
(3-2,Rick @ Gribnif) The ROM desktop only works with the ROM AES, etc.
That's the way Atari wrote it. It doesn't even
work with MultiTOS. Hardwired.

The desktop is nothing but a "separate" program.
Stop thinking of it as part of the operating
system, will make it easier. Look at Windows 3.1
as an example.
(3-1,Brad [sysop]) <g> OK, but I though GENEVA was launched FROM the
desktop?
(3-2,Rick @ Gribnif) Sure, why not? You launch Geneva, it basically
"re-starts" your system into our brand new AES
environment.
(3-2,Rick @ Gribnif) When you quit, it returns you to where you were
in the old environment.
(3-1,Brad [sysop]) Oh, OK, I see.

(3-1,Brad [sysop]) Is 9/1 still the release date?
(3-2,Rick @ Gribnif) Beta version shipped today, so I guess we are
looking good. (You can still order the beta
version, btw.)
(3-1,Brad [sysop]) How will it be distributed... mail-order and also
retail?
(3-2,Rick @ Gribnif) The final version will go everywhere
(retail, mail order, direct, etc.)
(3-3,Mike Mortilla) Rick, Will Geneva save the current activity
(like Revolver's Roll Out)?
(3-2,Rick @ Gribnif) Mike. The comparison doesn't apply. Revolver
partitioned the ST's memory into multiple
computers. Geneva is more like Windows,
allowing multiple GEM applications to co-exist
in the same ST.
(3-3,Mike Mortilla) Then can you save a "preferences" file?
(3-2,Rick @ Gribnif) What do you mean?
(3-3,Mike Mortilla) To run certain programs all the time w/o loading
every time?
(3-2,Rick @ Gribnif) Mike, you mean like having multiple program sets
launched at once?
(3-3,Mike Mortilla) Yes! Sequencing/Notation for 1. Word
Processing/DTP as another.
(3-2,Rick @ Gribnif) You can specify any number of programs to be
loaded at bootup. With NeoDesk 4, we are adding
"program groups" so you can launch multiple
programs groups at once. (That's more of a
desktop feature.)
(3-3,Mike Mortilla) But you have run each program? I guess
w/Neodesk 4 it'll do it.
(3-2,Rick @ Gribnif) Actually correction. I *think* that with the
Geneva RUN command you can just select as many
programs as you want, and it will launch them all.

(3-2,Rick @ Gribnif) Multitasking is GREAT. I get so spoiled. I
keep 1st Word Plus and LDW Power loaded at all
times. Then load STalker whenever I want to
log into something.

(3-2,Rick @ Gribnif) I think the biggest difference between Geneva
and previous attempts at multitasking is that
Geneva "works".
(3-1,Brad [sysop]) Rather an important difference <g>.
(3-2,Rick @ Gribnif) True, but that seemed to be the key problem with
previous attempts.
(3-4,Rob Rasmussen) I just got Midi Spy, which is "supposed to work"
with everything, but with all the TSR's and ACCs
I use, something conflicts.
(3-2,Rick @ Gribnif) That's cool. I hear it is quite the program.
Codehead stuff is pretty good, so even if there
is some small quirk, it would be easy to fix.
Geneva has a lot of compatibility "Flags" that
let you customize how a program runs. Most of
these will be preset, but you can tweek things
to make them work better.
(3-4,Rob Rasmussen) I guess any new prg I add like that, or Geneva,
would take some tweeking or adjusting.
(3-4,Rob Rasmussen) How practical on a 1040 ST with TOS 1.4 and
4 megs RAM?
(3-2,Rick @ Gribnif) Very. That's basically the same EXACT setup I
have on my 4 meg, TOS1.4 STacy. It works great,
I use it all the time. Heck...all our employees
have 4 meg, 68000 machines. One one TT in
(3-2,Rick @ Gribnif) the main office.
(3-4,Rob Rasmussen) Would it affect the ram disk (the one I use is
one meg)?
(3-1,Brad [sysop]) Good question.
(3-2,Rick @ Gribnif) Should work fine with the ramdisk. Geneva only
needs 120K (actually, current BETA version uses
114K).
(3-4,Rob Rasmussen) Maybe Shadow is an old prg and hasn't been updated.
(3-2,Rick @ Gribnif) Not really familiar with it. But since we don't
replace TOS, I am not too worried about it.
Should work. (Ramdisk programs work at the TOS
level.)
(3-2,Rick @ Gribnif) If we make the cartridge version, it will take 0K.
Even save you some, as we don't load the ROM
desktop.
(3-2,Rick @ Gribnif) We've been working on Geneva for two years...
it's not an overnight hack.
(3-4,Rob Rasmussen) Still using DeskCart cartridge for the clock!
(3-2,Rick @ Gribnif) Heh...oh well...run the disk version...
(3-4,Rob Rasmussen) Will Toad be selling it?
(3-2,Rick @ Gribnif) Sure, Toad sells lots of our stuff...
(in good numbers).
(3-4,Rob Rasmussen) OK, I'll check with them.
(3-2,Rick @ Gribnif) There are some screen shots you can download
from the Gribnif area in Atari Vendors.
(3-1,Brad [sysop]) Are you soliciting beta-testers?
(3-2,Rick @ Gribnif) We are. Download the file GEBETA.TXT from our

library here.
(3-1,Brad [sysop]) OK.

(3-4,Rob Rasmussen) What's the price again?
(3-2,Rick @ Gribnif) $99.95 - Geneva & NeoDesk 4 (our recommended
package) $69.95 - Geneva by itself
$50.00 - Beta price (you get the final release
free of charge)
(3-1,Brad [sysop]) Is NeoDesk 4 out yet?
(3-2,Rick @ Gribnif) No, NeoDesk 4 is a *major* rewrite with a whole
new look. It will come out with Geneva.
(3-4,Rob Rasmussen) Was MultiGEM a flop?
(3-2,Rick @ Gribnif) MultiGEM was a hack. It sort of worked, but was
too limited. Plus it had no enhancements. If
Geneva didn't multitask, it would still sell
just for the 3D buttons, tear off menus,
unlimited DAs, etc. Plus the fact that you can
run AES 4.0 applications on any machine
(for compatibility with newer applications).
(3-4,Rob Rasmussen) Would I get the 3D buttons and those menus on an
ST, or only on a Falcon?
(3-2,Rick @ Gribnif) Rob....."there are no limitations". You can
get EVERY feature on a 512K, TOS 1.0,
low-resolution (hooked up to a TV set) ST.
(3-4,Rob Rasmussen) I'll look for those screen shots
(3-2,Rick @ Gribnif) Actually...I haven't tried it...but it might
even work with disk loaded TOS. <grin>
It would even work on one of those 256K STs
Atari sold during the first months in Europe.
Hee hee.
(3-4,Rob Rasmussen) It replaces the desktop, but isn't NeoDesk the
"desktop"?
(3-2,Rick @ Gribnif) The "desktop" is a separate program from the
operating system. We don't do anything with it.
NeoDesk is a recommended desktop that works
great with Geneva.
(3-2,Rick @ Gribnif) NeoDesk 4 will have many Geneva/Multitasking
specialized features.
(3-4,Rob Rasmussen) Where are the 3D buttons?
(3-2,Rick @ Gribnif) Everywhere...all window gadgets, all alert boxes,
most dialog boxes... Ever see Windows 3.1? If
you have, you get the idea.
(3-4,Rob Rasmussen) No I haven't, guess I'm one of the few.
(3-2,Rick @ Gribnif) They go "down" when you push them with mouse.
Kinda cute. You can turn that off, though, if
you miss the older flat look.
(3-4,Rob Rasmussen) Sounds fascinating, I'll check it out!
(3-2,Rick @ Gribnif) Screen shot shows them pretty good...
Plus, unlike Windows or MultiTOS, if you have a
program that "slows" down your system, you can

just put it to "sleep" when you want to keep it
(loaded but don't need it running. Get all your
speed back.
(3-1,Brad [sysop]) Great feature!
(3-2,Rick @ Gribnif) I wish our stupid PC (running Windows) had that
feature. I can't wait for a good review
comparing Geneva to Windows...<grin>.
(3-1,Brad [sysop]) <g>

(3-2,Rick @ Gribnif) I have a question. Do you guys like the name
Geneva? We spent 2 months on a name...had a
hard time finding the right one.
(3-4,Rob Rasmussen) I was wondering about the name...
(3-1,Brad [sysop]) I like it. What made you choose it?
(3-2,Rick @ Gribnif) Considered hundreds...probably thousands of names.
(3-2,Rick @ Gribnif) It stands for a city that brings "different"
countries together, like we bring programs
together. It is in a country that no one dislikes.
(3-1,Brad [sysop]) That's what I thought. I like it!
(3-2,Rick @ Gribnif) And the "foreign city" name gave it an exotic
name...pointing to its uniqueness.
(3-2,Rick @ Gribnif) It also wasn't a preposterous name...
better than calling it "MultiMax Plus Ultra
Pro II" or some other horrible techy name.
(3-1,Brad [sysop]) <g>
(3-2,Rick @ Gribnif) During beta we used to call it "Magic".
(3-1,Brad [sysop]) GENEVA is better.
(3-2,Rick @ Gribnif) You know...if you take Geneva (replacement AES),
NVDI (replacement VDI), PowerDOS (replacement
TOS)...you could build.....a.......
clone ROM!
(3-1,Brad [sysop]) Hmmm!
(3-2,Rick @ Gribnif) It's an idea...though I doubt anybody has the
money to do it...
(3-4,Rob Rasmussen) And I'll bet someone already has? <g>
(3-2,Rick @ Gribnif) They haven't talked to us. We are the only
complete replacement AES (as far as we or anyone
we've talked to knows). The AES is the biggest
nightmare on the Atari to deal with, which is why
nobody has tried it before.
(3-2,Rick @ Gribnif) Well, I'll be at the Asheville, NC show in a week
from now showing Geneva. I'll also be at the
Indianapolis show. People can go there and see
it running.
Or they can just call us at (413) 247-5620 and
order their own beta copy today!
(3-1,Brad [sysop]) When is the Asheville show exactly?
(3-2,Rick @ Gribnif) Next weekend, Sat & Sunday.
(3-1,Brad [sysop]) When is the Indianapolis show?
(3-2,Rick @ Gribnif) The weekend after that. Saturday only.

(3-1,Brad [sysop]) OK!
(3-1,Brad [sysop]) Well, thanks Rick for taking the time to CO...
(3-2,Rick @ Gribnif) Your welcome.
(3-1,Brad [sysop]) I have a much clearer understanding not only
of GENEVA, but how TOS works in general!
(3-4,Rob Rasmussen) Thanks Rick and Brad
(3-2,Rick @ Gribnif) Reminds me of when we released NeoDesk. Spent a
lot of time explaining to people what a desktop
was and how we could replace it.
(3-1,Brad [sysop]) Well, we can do this again at the release date if
you want; just let me know.
(3-2,Rick @ Gribnif) Sure...it is no problem for me.

****

(Transcript ends.)

Hope that cleared up a few questions for all you anxious Atari types.

Yes, I know what you mean. I have an ATARI SC1435 color monitor, and am not
getting anything out of it other than the stereo sound! I have a 14' monitor,
but the actual screen is the same size as the 12' monitor, and THAT has a
border! Well I also have an ATARI 1040 STE, TOS 1.62. I had heard that you
couldn't get overscan to work on an STE, but if you find out please let me
know.

Thanks,

oR> Give it a try, it's avaiable on many BBSs.

I have ported a version of the "real" GNU Emacs (18.59) for the st/tt
running under MiNT. It features all the stuff from Un*x Emacs, like shell
in a window, compiling in the background +++. It should be at
atari.archive, directory Mint/Editors, file mntemacs.tar.z for the
TT-version, or stemacs.tar.z for the non-68030 ataris. (*NOTE* the
filenames may have changed)

1610. wanted: Atari ST

Newsgroup: comp.sys.atari.st
Date: 1993-07-18 21:22:12 UTC
From: ps1@cbnewsi.cb.att.com
Message-ID: <CADq12.4tG@cbnewsi.cb.att.com>
Source record: 203694

Hi,

I want to buy a used Atari ST, mainly to run some MIDI applications.
Can be a 1040 or Mega model etc., as long it is ST compatible.
I need a b/w monitor too. A harddisk would not be that important now.
Just in case, I would prefer a SCSI HD and an interface to the Atari
HD port.
Send reasonable offers to: ps1@spin.att.com

Thanks, Peter

1611. Falcon software? (comm, MIDI and others)

Newsgroup: comp.sys.atari.st
Date: 1993-07-18 21:28:32 UTC
From: azog@world.std.com
Message-ID: <CADqBL.78G@world.std.com>
Source record: 203695

I am still using good ol' Uniterm for my communications, but now on
a Falcon, its starting to suck: it wont run properly under MultiTOS,
and looks horrible in any of the Falcons 'native' video modes so I
run it under ST High compatability mode...

So now Im wondering what others are using? I have Connect, but something
isnt right there: it locks up the RS-232 port. too bad, Connect looks
fine under MTOS and 16 colour mode...

And also, are there any Falcon specific MIDI sequencers? I have something
called MIDISoft Studio, by Passport. It runs, but only properly under
MTOS, and ST High... Id like something that allows me to take advantage
of the DSP, for all the fun stuff...

Finally, long time ago, before the Falcon was a reality, there was talk
about some DSP-specific stuff, like a video phone, and a software
modem, plus one or two others Ive forgotten. Any word on these?
I admit, I havent kept fully up to date on things, but do read AEO
on a semi-regular basis.

Thanx

>What's involved in connecting 2 hard drives (Megafile's)? I know you
>have to set some jumpers on one of the drives - which jumpers, and how
>should they be set?

A Megafile 20,30,60 or SH205 unit is changed from unit #0 to #1 by doing the
following:

Remove the top cover (9 screws, sitting in square holes)
Look through the larger holes in the metal shielding. Through one of them,
you'll find a set of 3 DIP switches.
Flip the middle one.
Reassemble.

>Also, what do you have to do in the operating system to get it to see
>both drives?

The driver on your unit #0 will do that automatically.

bye, Peter

>at all...

Well, it's from the "useless feature dept." (C) Atari Corp.

Seriously, since the pinout of the three SIMM types mentioned is the same, the
256 KB SIMMs can also be used - at no extra cost for the board developper.

No end user will do so, though...

bye, Peter

: Try mgif4.? on a monochrome monitor, you can find it on a.a.u.e too.
: I don`t know which gifviewers are the best on color monitors.

: Hans Staalman

There are a couple of GIF viewers I know of:

GEMview : Displays GIFs and a whole lot of others, try to find the
latest version for compatibility with the Falcon.

ViewGIF: Fairly decent, but can't convert GIFs larger than 320*200 to
Spectrum 512 format.

Photochrome V3: Probably the best. Squashes GIFs to fit on screen,
has a 4096 colour mode on normal ST's and a 19,200
colour mode on STE's which looks absolutely stunning.
Can also save in Spectrum 512 format and its own
special Photochrome format. Who needs a graphics
board with stuff this good!

Hope that's of some help.

: Mach32 for sale (includes 400 dpi BUS mouse) $355

Not to piss you off, but the ATI GUP Mach32 ISA can be had new for $315
from DPS in colorado...800-669-8194. They also have the VLB version for
the same price and the EISA version for $329!!! The Plus is only $209.
All these are the OEM version (the poster is advertising the retail version),
so no mouse is included. These are new boards...ATI just drastically dropped
the price on this stuff in preparation for it's new line due out soon.

Clean GEM program, but slow (written in C), will work with any Atari in any resolution. Good dithering algorithms, but no support of time-critical Spectrum interrupts, of course.

> Photochrome V3: Probably the best. Squashes GIFs to fit on screen,

Dirty as hell. Won't work on anything than ST/STE computers in 320*200 rez.

1624. TruePaint - opinions wanted (esp. on TT)

Newsgroup: comp.sys.atari.st
Date: 1993-07-19 06:55:42 UTC
From: warwick@cs.uq.oz.au
Message-ID: <14377@uqcspe.cs.uq.oz.au>
Source record: 203555

I'm looking at getting TruePaint for my TT. The only features I really need are:

- Arbitrary resolutions (up to 640x480x16 at least)
- Zoom-in modes for pixel-by-pixel editing
- Output in useful formats like GIF

Any opinions from users please!

Hello.

I'm searching for a Common Lisp for Atari ST.
(Hopefully Free-, Shareware or PD....)
If you have one or know how (where on Internet) to get
one, please mail to:
b_becker@informatik.uni-kl.de
or send a reply for this article.

Thank you.

Stefan Huelbrock & Bjoern Becker.

Not on my ST. I just tried it again and it still creates absolute paths.
Maybe different behaviour in different ZOO versions? I use zoo 2.1
(date 1991/07/14) from ftp.cs.ruu.nl.

This is not the problem. Zoo really knows how to handle the path separator on
all platforms.
The problem with absolute paths is that on Unix systems users can't create
files or directories in the root directory (/). Only the superuser (root)
can do things like that.
But, as is said before by a few others, you can solve this problem by forcing
zoo to extract to the current directory.

1633. cron for ST

Newsgroup: comp.sys.atari.st
Date: 1993-07-19 14:30:48 UTC
From: lemmens@dutind5.twi.tudelft.nl
Message-ID: <1993Jul19.143048.13013@donau.et.tudelft.nl>
Source record: 203568

Hi folks,

I have built a cron program for the ATARI & MULTITOS, because I couldn't find
a cron for ST on any of the FTP sites. Was a lot of work after all !

This cron behaves in (almost) the same way as the UNIX cron: it can start jobs
(in the background) at regular intervals.

This can vary from playing a tune on your synthesizer every hour, make a
backup every Friday at 02:00 AM to collecting mail automatically twice
an hour or so over your telephone line.
All output produced by the programs is send as mail to the user who
submitted the job, including the exit status.

Cron can run up to 5 jobs at the same time and has an internal joblist of
25 jobs maximum. This could easily be increased, but that is to prevent overloading the
system.
Default priority for all processes is -5, so it is also 'nice' to other users.

Many timemasks are possible: intervals, commma separated specifications and
* for setting all possible values. (just the same as UNIX)

The programs are started by the Mintshel, so the syntax of the commands should
be according the Mintshel rules. (redirection and piping is also possible.)

I'm curious what you think of it ! Please let me know if anyone is interested
in these things.

It is available on atari.archive as soon as I'm able to connect and I already
put it on ftp.tu-clausthal.de

1634. Ghostscript 2.6.1

Newsgroup: comp.sys.atari.st
Date: 1993-07-19 14:31:41 UTC
From: c0031098@ws.rz.tu-bs.de
Message-ID: <1993Jul19.143141.9905@ibr.cs.tu-bs.de>
Source record: 203564

Hi,

is someone out there, who is porting GS 2.6.1 to the
Atari?

There is no information about the Atari specific graphic modes,
thats why i wont try it myself.

The reason i'm asking is the following:

GS 2.5.2 works fine, even with MiNT, but every time i get
a VM-error (which is very often since i have only 4 MB) the
system crashes with an illegal instruction and leaves MiNT
=> reboot.

Another problem is, whenever an error occurs reading a file,
the file will never be closed, thus writing to this file from
my editor fails.

Maybe recompiling GS 2.5.2 with a new gcc and the new MiNTLib
will fix some of the problems, but GS 2.6.1 will sure be much
better.

Axel Kielhorn

c0031098@ws.rz.tu-bs.de

PS: Even without GS 2.6.1 it is a good idea to get the
GS2.6 fonts:
There a four new fonts with Umlauten like "a"o"u etc.
The Courier and Bitstream Charter fonts are real Type 1
not converted Bitmaps.

1637. GCC 2.4.5

Newsgroup: comp.sys.atari.st
Date: 1993-07-19 15:08:59 UTC
From: c0031098@ws.rz.tu-bs.de
Message-ID: <1993Jul19.150859.11272@ibr.cs.tu-bs.de>
Source record: 203567

Help!

I got the gcc 2.4.2 some weeks ago in order to use the
new MiNTLib 32.
After linking the GNU names to the MiNT names i had
no problems using it.
Last week i got gcc2.4.4 (binary only)

My question is what are the differences between the
diferent gcc Versions?
I started with 2.2.2, switched to 2.3.3 and now i have 2.4.4.

But with neither Version came a history file.

Thats why i fetched the source this morning:
5 MB gzip, 21 MB unziped!
I had no idea where to look for the changes.
(The diffs didn't help either)

Will i have to recompile everything compiled with gcc 2.4.2 with
gcc 2.4.4 in order to remove some bugs, get better optimizing, etc.?

Well, i will have to recompile the old <2.4.2 things to use
the new lib, that's sure.

Any help is welcome.

As I understand it, the cold fusion power source will only be an option in the future, if at all. The entry product uses a conventional fission device.

I have today (or WILL - if I can get access!!) downloaded my Bootsector, Fats & Rootdirectory backup utility (BFRDBU10.ZOO) to a.a.

This is a program to safeguard against disaster should your Hard Disk Fats and RootDirectory Info be corrupted - by imperfect hardware and/or software - as has, alas, been reported quite often to this Newsgroup in the past few months. It enables the Fats and RootDirectory Info of specified Hard-Disk Partitions or other Volume(s) to be quickly saved to .FBU files on floppy A:\. The info on these can be restored should disaster occur. It takes but a minute or so to back up this Info for ALL partitions on a 100 Mbyte Hard Disk - and so you can afford to do this backup every time you boot-up by including BFRDBU.PRG as one of your AUTO Folder Programs. Also it can safely be used with BGM partitions. Only you can judge whether your Hard Disk is sufficiently reliable for you NOT to take this precaution.

Further - suppose you typed "rm *" whilst in directory C:\ from a shell by mistake - and the shell promptly goes about deleting very many files before, in panic, you hit the Warm-Reset button - then, as I found (once), the easiest way to redeem the situation is to restore the FATS & Root Directory Info if you have a fairly recent copy. All files that have not been disturbed since the backup was made become accessible again thus avoiding utter disaster (note "UNDELETE" programs fail with fragmented files).

Anyway, personally, I've found this useful over the past two or three years and I think many out there might also. As it's easy, I reproduce below an extract from the DOC file that accompanies BFRDBU.PRG - so that you can judge whether it's what you've been waiting for or not.

Cheers,
W. Alan B. Evans

********** Extract from BFRDBU.DOC **********

A few years ago, I had Hard Disk Troubles of the kind that led to the FATS and ROOTDIRECTORY info on my SH205 being frequently over-written. This of course results in making the files on that partition, though largely undamaged, virtually inaccessible. In an ideal world this should NEVER happen but imperfect hardware and/or software can lead to this disastrous situation. Initially I wrote a "full" Hard Disk backup program (HDQBUR - "Hard Disk Quick Backup & Restore" which was distributed to the Archives in the past as part of HD_UTILS). However, a "full" sector copy backup to floppies takes

rather a long time AND uses rather many floppies. I quickly realised that what I really needed was an utility that simply copied the FATS/ROOTDIRECTORY Info on a selected Partition to file (stored on floppy or, perhaps, on another Partition). This of course is quick and can be done every time you boot up. Then if a subsequent disaster occurs this info can be restored and thus access is regained to the locations of ALL rootdirectory files (and directories) that have not been altered since the last backup - provided, of course, they are undamaged by the initial disaster!!. However new files you may have created or files that have been edited since the last backup will of course be lost or "uncomplete". But often this is not so bad as they tend to be fresh in your mind and are usually fairly easily redeemable from some other source (e.g. floppy copy etc.). After "restoring" such Partitions it is advisable to check its FATS' integrity with some suitable Utility such as ICD's "CLEANUP" (which I personally find excellent) or, maybe, with Jorge Lohse's FSCK.PRG (though this is old and works only on non-extended {<= 16 Mbyte} and non-BGM partitions) and doubtless with other more recent disk-tools. Most imperfect files can be "weeded-out" this way.

Thus BFRDBU.PRG came to be born - and in the past couple of years has saved me a great deal of hassle, alas on several occasions. However I was under the impression that my "problem" Hard Disk was rather uncommon, but reading various ST-Newsgroups over the past few months alerted me to several others who have experienced similar difficulties. This prompted me to "tidy-up" the program a bit and offer it to the PD Archives - hence this submission. Basically BFRDBU is a simple program that makes minimal use of GEM - and is configured so that it can be optionally used as an AUTO-folder backup program at boot time.

BFRDBU will save the Bootsector-Fats-Rootdirectory Info on selected partitions (or Volumes) into .FBU (Fats Back-Up) files such as C_BFRD.FBU, .., E_BFRD.FBU that are saved on the Floppy Drive A:\. (an alternative scheme would be to save these in different partitions cyclically - e.g. if you have Partitions C:\, D:\ and E:\, then save C_BFRD.FBU to D:\, D_BFRD.FBU to E:\ and E_BFRD.FBU to C:\ - but the current BFRDBU.PRG does not offer this feature though it would make the back-ups even faster). Note the first letter of the Filename corresponds to that of the Volume whose info is saved in the file. BFRDBU also maintains one level of backup in .BAK files e.g. C_BFRD.BAK etc. The selection of drives to be backed is done simply by entering a string e.g. "CEF" (case or order does not matter) which is made up of the Drive Letters of all selected drives i.e. in this example you would be selecting Partitions C:\, E:\ anf F:\. The BACKUP option of BFRDBU does not use any GEM and so may be used at booting-up time. However, for the RESTORE option I thought it convenient to have some FormAlerts and the GEM FileSelector so that this (hopefully rarely needed) option must be done after boot-up within the GEM/AES environment. No elaborate explanations are needed - BFRDBU will prompt you with simple questions at each stage. Note it

does take into account logical sector size so that you can safely use it on BGM Partitions etc. (I have been doing so for years!).

I note, recently, that this simple (obvious?) idea has also been utilised in the recent (and, by all accounts, quite comprehensive) Disk Utility Program "Diamond Edge" of John Cordes et. al. (the UK importers are Hisoft). From what I read, I think "Diamond Edge" (in its "quick-backup" or whatever-they-call-it option) goes further than BFRDBU in that it will also store all subdirectory tree info also on the floppy. Of course, this is, in principle, better than the task that BFRDBU currently performs. However, it will take that much longer time and, of course, will still not be as good as a "full" backup. I will simply say that I, personally, have yet to know of an accident where both subdirectory AND rootdirectory contents were simultaneously damaged but with virtually all the files intact. Thus I never found it necessary to code this "subdirectory" feature in and I trust this will also be true for most potential users of BFRDBU. It does help a little if you ensure that the FIRST file on your disk (that follows immediately after the rootdirectory ends) is NOT a subdirecory sector but, preferably, some large, static and easily-replaced program e.g. CALAMUS.PRG or similar. If you _must_ have all Rootdirecory AND Subdirectory Info backed, then investigate "Diamond Edge".

Good Luck,
W. Alan B. Evans. July 1993.

In Friday's Investor's Business Daily at the beginning of the NYSE quotation page, there is a "what happened today in the market" article. It quoted some analyst who is really bullish on several well-known companies _and_ Atari Corp.

Once the analysts begin recommending a stock, the limit on "how high is up" is pretty high.

I am looking to see if there is a market for my atari 850 serial/parallel interface. I got it several years ago and its collecting dust in my closet. If you would be interested in buying this, please E-mail me at the following: dkibler@wrdis01.robins.af.mil and we can discuss terms.

By the way, I even have a cable for a printer I would be willing to part with too! Thanks in advance!!

>I'm looking at getting TruePaint for my TT. The only features I really
>need are:
>
> - Arbitrary resolutions (up to 640x480x16 at least)

Yes.

> - Zoom-in modes for pixel-by-pixel editing

Yes.

> - Output in useful formats like GIF

GIF, not yet; the current list of output formats is IMG, XIMG, Prism Paint, Art Director, MTV Raytracer (simple raw format), TIFF, JPEG and an internal format (for speed).

GIF export is on my to do list, plus I have many more importers on the drawing board; as of last count I think there were 22 import filters which we had working in house, including things like PhotoCD.

Here it is:

```
------------------
Gribnif Software
News Release
June 30, 1993

/----------\
| Geneva |
\----------/

Multitasking Application Environment
====================================

After almost two years of development, Gribnif Software is proud to
announce their newest software offering for the Atari ST, STE, TT/030,
Falcon, and compatibles.

"Geneva" is a Multitasking Application Environment (Multitasking AES)
that allows any Atari to:

o Multitask unlimited GEM applications+
o Load and unload unlimited desk accessories+
o Put applications and accessories to "sleep", keeping them from using
valuable CPU time, temporarily closing all their windows.
o Run MultiTOS applications (it supports the new AES 4.0 calls)

+ subject to available memory

Geneva also adds the following features to the Atari:

o Task Manager
-for total control of all applications and accessories
o Tear-off menus
-drag any drop-down menu into its own window
o 3-D buttons and 3-D window gadgets
-easily customizable
o Keyboard control of drop-down menus
-similar to Windows, "walk the menus" of any application
o Ability to run singletasking applications
```

-for applications that are not multitasking compatible
o Enhanced compatibility when compared to Atari's MultiTOS
-special flags let you run even the most troublesome programs
o Keyboard control of window gadgets & dialog buttons
-keyboard equivalents for dialog & alert buttons, plus the
ability to assign keyboard equivalents to window gadgets
o Ability to change mouse shapes, including mouse animation support
o MiNT compatibility for MiNT applications
-multitask TOS programs, run MiNT-specific applications,
requires either freeware or commercial version of MiNT
o Enhanced file selector
-with powerful pattern matching, file searching, renaming,
deleting, dual column display, and multiple file selection

When compared to Atari's MultiTOS, Geneva offers the following
advantages:

o Smaller memory requirements (less than 125K of RAM when active)
o Faster application speed, mostly due to Geneva not requiring
MiNT loaded to multitask GEM applications.
o Faster window redraw and window gadget operation, due to Geneva's
faster AES code.
o Higher compatibility with older applications, thanks to Geneva's
special application flags and support for singletasking
applications.

If you do NOT have MultiTOS, Geneva offers you:

o A very easy and fast way to multitask unlimited GEM applications,
subject to available memory.
o The ability to load and unload unlimited desk accessories as you
need them, subject to available memory.
o The ability to run AES 4.0 (MultiTOS) applications.
o An inexpensive way to give your computer a whole new look & feel,
including 3-D buttons, tear-off menus, multitasking, keyboard
control, and much more.

If you DO have MultiTOS, Geneva offers you:

o A faster AES which offers several new features, including tear-off
menus, keyboard controls, faster windows, and higher compatibility.
o Higher compatibility, thanks to Geneva's special application flags
and support for singletasking applications.
o The ability to not have to run MiNT, therefore giving you:
> A faster way to multitask unlimited GEM applications,
subject to available memory.
> The ability to save substantial amounts of memory.
> Even higher compatibility with non-MiNT compatible
applications.

What Geneva does NOT include:

o Geneva does not include or require a "desktop". The built-in ROM desktop is not compatible (if we could make it so, we would). But, a desktop is not required. You can launch programs and accessories directly from Geneva's Task Manager.

However, for convenience, a desktop replacement is recommended. Geneva will work most MultiTOS compatible replacement desktops and file launching shells.

Also, a patch is included with Geneva that upgrades NeoDesk 3 to version 3.04, allowing it to work correctly with Geneva.

We recommend the soon to be released NeoDesk 4 desktop replacement, which will include many new multitasking oriented features, window menus, true color support, and will take full advantage of Geneva's power and capabilities.

o Currently, Geneva does not include MiNT, the TOS enhancement written by Atari for use with MultiTOS. However, Geneva is fully compatible with MiNT, allowing you to run MiNT applications and multitask TOS applications. Geneva is compatible both with the freeware version of MiNT and Atari's commercial version.

Some common questions and answers about Geneva:

Q: Will I still be able to use my screen accelerator together with Geneva to speed up my Atari?
A: Of course! Geneva does not replace the VDI, the part of the Atari in charge of drawing. It works great with programs like "Warp 9" and "NVDI 2.0"

Q: Do I have to reset my machine to load Geneva, like with MultiTOS?
A: Nope! You can easily load Geneva right from the built-in desktop (or your favorite shell). No need to reboot the computer.

Q: How compatible is it?
A: Quite. Almost any program can be executed. The real question is if a specific GEM program can actually support multitasking. You will find that many do, but some programs, like the original Flash, will only run in singletaskting mode. Other compatibility options in Geneva let you specify if an application can receive AES 4.0 (MultiTOS) messages, should only use a specific amount of memory, or any other special handling it might require.

Q: How does singletasking work?
A: Geneva is aware that certain applications are not multitasking compatible. When you run Flash, for instance, all other GEM applications are temporarily suspended until you either quit Flash or suspend it (letting you switch back to the other multitasking applications while keeping Flash loaded in memory). However, you still have full access to all of Geneva's other capabilities, including the ability to load and unload desk accessories.

Q: How complex is it to set all these settings?
A: It isn't at all. To make things even easier, Geneva keeps a special GENEVA.CNF file which serves as a small database that already tells Geneva how to run most programs. We will continue to update this file (releasing it on-line, etc.) as we try out more and more programs with Geneva. This means that all you may have to do is actually run your programs, the settings are most likely already set!

Q: What about TOS (text based) programs?
A: Currently, TOS programs run as singletasking applications. In Geneva they run inside their own GEM window, allowing you to easily change their font size and control their output. However, if you run the freeware or commercial version of MiNT, you can multitask TOS programs.

Q: Can I still use file selector replacements like UIS III or Little Green Selector?
A: Yes, they will work, though you might find that they might not support some of the more advanced Geneva features (such as the advanced pattern matching, selecting multiple files at once, etc.)

Q: I'm a developer, how can I take advantage of Geneva's new features and capabilities?
A: Every copy of Geneva includes a complete developer's kit. This includes full information, libraries, and sample code on how you can easily take advantage of Geneva's power and capabilities. There are no royalties or licenses involved in making your application "Geneva Aware".

Release Dates & Prices:

"Geneva" is slated for release in North America around September 1st, 1993. Foreign versions, including a German version, will be available shortly thereafter.

"Geneva" will be available commercially from your local dealer for $99.95 and will include the new "NeoDesk 4" desktop replacement.

"Geneva" will also be available by itself (without NeoDesk 4) for $69.95. NeoDesk 4 will be available separately for $69.95.

It IS real, but sans CD. It has a 64 bit custom-designed RISC
processor and custom-designed DSP for sound, and will be manufactured
& distributed for Atari by none other than IBM (who will not take part
in advertising, etc.). This has been widely reported, even in the
news media, I'm suprised you haven't heard about it.

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi,

Thanks to all those who answered my question about the bug in vr_trnfm(). Now for a nice question about icon handling.

I recently began playing around with icons, and I have encountered the following problem. There appears to be no way to tell when an the image of an icon has been corrupted by a window from another program.

I can draw an icon on the screen with objc_draw, select it, move it around, and even redraw it if a window from my own application destroys the icon image. BUT if the icon is covered by a window from another application (like the xcontrol window), there seems to be no way for my program to find out. What is generally done in such cases?

Thanks,

-Tim Gallivan

tra

Attention Atari 7800 collectors!

I have access to a limited number of the following Atari 7800 video game
cartridges. These are NEW, in the box, in the shrinkwrap, with manuals.
I can sell these for $5 each plus $1 per cartridge for shipping, up to $5.
Please send me Email if interested!

The number next to the title is how many are left.
Pole Position II - 10
Jinks - 3
Choplifter - 10
Robotron: 2084 - 8
Crossbow - 3 (two not in shrinkwrap)
Hat Trick (hockey) - 2 (No shrinkwrap)
Food Fight - 1 (No shrinkwrap)
Asteroids - 2 (one not in shrinkwrap)
Ballblazer - 3
Xevious - 1 (No shrinkwrap)

A few of these are no longer in the shrinkwrap, but the package is in good
shape, and I have tested the cartidges myself to ensure that they work.

There are a few of us Softies that use Atari. I also have an Amiga 2000
C64 and soon a genises VR kit.

Plus my wife wants a Mac (SSSHHUUUDDDEERRRR.... :-))

I ordered the beta test version; it should be here this week. I'll let
you all know what I think. From what I've heard, it's just the gap that
needs to be filled. There were until now no good replacements for the
AES; just desktop, VDI, and TOS replacements.

I don't think Geneva multitasks programs; it just allows them to run at the same time, same as the MultiTOS AES. The actual method of multitasking depends on what kernel is running. If you're using TOS, then it can only multitask cooperatively (like accessories). But if you're using MiNT, it will multitask preemptively. I'm sure the MultiTOS AES would do the same thing if it could be run without MiNT. They are both just replacement AES's that let more than one GEM program to run at once.

Hi,

I have a handy program called EDITV2_1 written by Damien M. Jones. It's a text screen editor that lets you paint in VT-52. The version that I have is 2.1 and it was last updated in 1990. If you are interested, I could UUencode it for u. Please, let me know in E-Mail.

1666. C=64 emulator?

: Has anyone done this modification to an STE machine?
No one has done this to a STE, because there is no possibility to do so.
Overscan works by manipulating the Controlsignals from the Glue to the MMU and
the Shifter. In the STE the Glue and the MMU are packed into one single chip.
So it is not possible to break the line between the Glue and the MMU.

[> comparing to this system ;-)
[>
[> Wolfgang

Is there any way to get Mag!x in Canada? Also, how much does it
cost? I have seen people saying they love it, and that there will
be a new version soon, but I have never seen anyone describe it.
How does it compare to MultiTOS (speed) on an 8MHZ ST? Does it
support the AES 4.0 system calls? Does it have any of the nice
features (but not neccessary) features of Geneva?

Lastly, how workable is it on a 2MB ST? (Oh, can you put a task
to sleep? That is one of the most interesting Geneva features I
have heard about. I do not need REAL Multi-Tasking for much, but
I could think of many uses for task-switching.) Real Multi-Tasking
would be nice if you could control how much of the system CPU is
used for each application. That way a compiler running in the background
would not bring the system to a halt (it would just be slower).

Hi there!

I really like my Atari, but I'm using a very stupid Text-Processor: 1st-Word+. It's really to slow to edit and print a Text of 200 pages or more. Now I'm looking for a converter for my 1st-Word Files to a PC-Format (Word, WordPerfect etc.) or even LaTeX (this would be the best!). Does anybody know such a program? The only thing I found on FTP-Servers was 1stw2ps, a converter to PostScript. This is fine for printing, but not for editing.

Thank's in forward!
Elmar Billen, Muenster, Germany.

As far as I know there is a wind_set call that lets you install your own
desktop background tree. So install it and let AES take care of redraws.
But make sure that you unset it before terminating your program by wind_setting
a NULL pointer.

Hope this helps
Ulrich

You cannot just draw onto the desktop - you must create your own
desktop (basically just a G_BOX with some sort of fill pattern, sized
to fit the screen) containing whatever icons (or whatever) you want to
display on it. Then use the wind_set(WF_NEWDESK, ...) call to register
your object tree with the AES.

I can't remember if the AES redraws it for you, or if you have to
catch redraws for window #0 (the desktop) yourself.

But having a new desktop is not very MultiTOS friendly, as all the
real desktop icons (etc) get obliterated.

Interlace does flicker of course, but ATARI has 'developed' a little bug for some
TV sets or the SC1224: The frame synchronisation is a bit wrong, so the half
screens are displayed on the screen in the wrong order and much more flickering
results. We are working on a patch...

Geneva uses event based multitasking when it is run without MiNT. When run with MiNT, it will do preemptive multitasking. It is true that you cannot truely multitask TOS apps without MiNT, but most of the time, at least for many users, this is not necessary. The advantage of Geneva is that it gives you the choice of whether or not to run MiNT. Without MiNT, it is much faster. Even with MiNT it is much more compatible than MultiTOS, especially with older applications.

****** $900 ********
****** $900 ********

I'm selling all of my ST equipment for the price listed at the
top of this message, $900 dollars. Please buy it!! I've grduated from school,
and due to work I've had to get an MS-Dos notebook instead (for what it's
worth, I prefer the ST - more intuitive and fun to use...sigh). I am only
interested in selling everything as a package, primarily because I do not have
the time to start splitting everything up. On the off chance that you want a
specific item, send me a bid. I will only consider giving a really good deal
to someone who either buys the entire setup, or at least a large chunk.
Here goes:

*** Mega ST2 (includes all upgrades listed)
- nice design, comfortable external keyboard, has room on the
motherboard to easily be upgraded to 4 meg

- MIDI ports

- TWEETY board installed (splits the ST's sound output into 2
channels to be played through your stereo)

- SWITCHABLE TOS 1.2/2.06 (the newest TOS, I installed the switch
myself; it allows you to have complete compatability with any
software by choosing the operating system it's most compatible
with. 2.06 is extremely fast and has TONS of features - nicer to
use than macs or windows IMHO)

- all the usual ports- parallel, serial, hard drive, 2nd floppy,
monitor, etc.

- golden image mouse

- extra atari mouse

- Warp 9 registered & installed

**20 meg hard drive

**SC1224 Color Monitor
- will accept either 60 or 50 hertz sinc

**SM124 Mono Monitor
- internally adjusted for maximum screen size

**2400 baud modem & software

**external DS/DD floppy

**Epson LQ-850 high speed 24 pin printer (needs ribbon)

**Navarone Video Digitizer

**Monitor Master

**Mouse Master

**software:
|
- I have a ton of stuff, almost everything you could ever need/want
word processing, telecomm, dtp, programming, graphics, music, a *TON*
of games.

I have *** 335 *** disks of software. Plus an additional 40 or so
blanks.

All appropriate cables, power supplies, and manuals are
included. All of the equipment is in extremely good condition.
Everything is clean and has been VERY well kept.

- I also have some of the boxes for the hardware (computer & 1
monitor I think.

****
Total cost $4,000 +
****
******
I will sell it all for $900 <---- (that's a good deal)
******

plus shipping (or will deliver within 2 hour driving time of Buffalo, NY)

If you are interested in what I've got, E-mail me at this account. I log
in daily..

.Philip

Ah, more brilliant ergonomic design from Atari. You should probably buy
a keyboard wrist-rest as soon as possible, so you don't develop
carpel-tunnel syndrome or other repetitive-motion diseases.

> The manual says the within the General CPX, the Blitter option may

There is a BLiTTER in your Falcon, but you can't turn it off... I don't
think the Falcon VDI works without the BLiTTER (good thing, too... it
can use all the extra speed it can get).

> I did run an old indexing program I had, and it reported a blitter,
> but it also reported a 68000 (at 40MHz)...

Hey, maybe you got a new and improved Falcon000 at 40Mhz! :-)

> Thats about it. All in all, I am pretty pleased, with some minor grumbles.
> Like why did Atari use the damned 9 pin RS-232C instead of the 25 pin?
> Why are there no pin signals on the DSP pinout?

9-pin RS-232C is quite a bit smaller than the 25-pin... is there room on
the back for a big RS-232C socket?

Then again, "Why didn't they use SIMMs?", "Why didn't they use a
detachable keyboard?", "Why didn't they use a 33Mhz '030?", etc... The
ways of Atari are mysterious...

I asked them about this. I was told that it was event driven multitasking
if used by itself. It is pre-emptive if used with MiNT.

1692. Geneva News

Newsgroup: comp.sys.atari.st
Date: 1993-07-21 06:32:07 UTC
From: jhoffman@netcom.com
Message-ID: <jhoffmanCAI4tJ.Lvv@netcom.com>
Source record: 203469

Wow! the Geneva betas for most people who signed up arrived today. I though
that I'd put a couple of comments up about my impressions after playing for
the last 5-6 hours.

Summary
Geneva is GREAT.

Detail
In some ways the environment under geneva is a bit like MS Windows. You will
have keyboard shortcuts for almost all menus, dialogs and window gadgets. You
can have applications setup that will all, some or almost none of geneva's
features. You don't setup the applications configuration via a pif file or
pifeditor. You instead have a taskmanager DA that allows you to set a large
number of flags for applications defined by names or wildcards. (ie *.tos
will have one set of flags while flash2.prg has another set.) So in the
best case you will have applications that will multitask, support 3d look,
keyboard shortcuts, and various other minor features. In the worst case you
will have an application that works just like it did without geneva minus
a bit of memory but with task switching. I guess some tos type programs
might not support task switching.

Speed, this is where Geneva differs from MS Windows. Geneva is fast. I've
not run zilions of apps at once but I have been running the task manager,
help system, edhak, and playing with neodesk all at once without any real
noticable difference in speed. Right now I'm running Neodesk, Geneva,
Task Manager and Flash2. I don't notice any difference in operation with
flash2.

Compatability, I've only run 6-8 programs so far but I think it is significant
that nothing I've tried running hasn't worked. Oh I almost forgot, I accidently
loaded about 10 Desk Accessories at once...

So Geneva adds function to your environment. Doesn't cost speed or
compatability. Provides a method for old ST machines to get access to
AES 4.0 and Multitasking. Lastly, this is only the beta version the final
version will be better.

I think that you might want to send Gribnif Software some email at.
75300.1131@compuserve.com

BTW I am not in any way associated with Gribnif. I'm just a very Happy
ST owner.

John

>beta in public.
Obviously quite a clever decision. ;-)

What could be a better commercial than a satisfied customer ? ;-)

However we should not forget that everything has to be compared to
the original, MultiTOS.
I doubt that MiNT is - as Wolfgang puts it - slow. And i do think
that Eric works hard to make it faster... (Eric, do you ? ;-))
Personally - having the opportunity to work with MultiTOS on my TT -
I think that MiNT / MultiAES is quite a good combination to work
with - at least on powerfull machines

Sounds quite impressive. If I hadn't access to the Mag!x 2.0 Beta I'd
surely consider to buy Geneva. But with Mag!x I have have a complete
replacement for the ATARI OS which is compatible to TOS but lots of
faster. I will have to generate some benchmarks in the next days. In
addition, Mag!x offers preemptive multitasking, yes - PREEMPTIVE multitasking -
without relying on the slow MiNT Kernel. It recently got a impressive
speed improvement for its serial devices and running Flash2 on Mag!X
will let you notice a enormous difference in operation speed - it will
be lots of faster.
For the AES, Mag!X now is nearly AES 4.0 compatible.

>BTW I am not in any way associated with Gribnif. I'm just a very Happy

1697. GEM-Files questions ...

Newsgroup: comp.sys.atari.st
Date: 1993-07-21 12:25:31 UTC
From: in11wpcg@sbusol.rz.uni-sb.de
Message-ID: <22jcjrINNb9m@sbusol.rz.uni-sb.de>
Source record: 203476

Hi there.

I have a problem. I have a set of really huge .gem-Files, and I want
to change the linewidth of some of the objects in the .gem files.
Because the gem-files are really big, and there are lots of lines
to change, I don't want to make it with a standard software package.
I think writing a program to make the changes would be a better solution.

So I have the following questions:

1.) Is there a program which does some line-style changing on gem Files ?
2.) If not, is C-source-Code for reading/writing gem-format available via
anonymous FTP ?
3.) If not, where is a description of the gem File-Format so I can write
a program of my own ?

Thanks in advance for your answers.

>fine under MTOS and 16 colour mode...

CoNnect 2.02 works great on my FALCON (tested with TOS 4.01 and 4.04). If you
have TOS 4.02, there might some problems. If you have an older version
of CoNnect (<= 1.92 i think), it won't work, too.

Also note there are two official FALCON-Patches: FPATCH1 and FPATCH2.
Both try to solve Bconmap problems on TOS 4.00-4.04 in a very different
way. Try both. (Rufus 1.20-1.30 works only with FPATCH1, 'cause the
author means he's right and FPATCH2 is wrong. How ignorant!). Since
CoNnect 2.0 (with fast internal ZModem!) it works great with MultiTOS!
Uploads with 1900cps are possible (57600 baud, 16800/V.42b). Download is
not that fast, but this will be fixed, because FastSer (0.95) will be
available for FALCON very soon! With latest beta-Version we got 5600cps
(57600 baud, nullmodem to MSTE).

>And also, are there any Falcon specific MIDI sequencers? I have something
>called MIDISoft Studio, by Passport. It runs, but only properly under
>MTOS, and ST High... Id like something that allows me to take advantage
>of the DSP, for all the fun stuff...

I'm not in the music scene, but Cubase Audio for FALCON seems to be
great!

>Finally, long time ago, before the Falcon was a reality, there was talk
>about some DSP-specific stuff, like a video phone, and a software
>modem, plus one or two others Ive forgotten. Any word on these?
>I admit, I havent kept fully up to date on things, but do read AEO
>on a semi-regular basis.

I would be interested in that things, too. But the actual FALCON seems
too slow for such things. There are some hardwarerecording tools
using DSP available (Winrec (Shareware) and some (even worse) commercial
stuff). With Wincut you can cut your samples and Fortune plays and
converts (nearly) any Sample on your FALCON. There is a JPEG-Viewer from
Brainstorm available, using DSP for decrunching. There are some fractal
programs using DSP, too.

OK - MiNT certainly is the best enhancement to TOS we've had so far
and it's way to Posix is the right direction. MiNT itself is not slow
but comparing it to Mag!X (which does not provide MiNTs Posix like
features so far!) there is an incredible speed difference. Ok -
let's say - Magix is faster ;-)

These questions have been discussed to death already in this newsgroup,
but once again:

- SIMMs are too big to fit in the Falcon030 case
- A detachable keyboard wasn't used according to Atari because
1) The Mega STe and TT cases were not considered appropriate for
a consumer machine.
2) It would have been too expensive and/or time-consuming to
design a new case.
- They didn't use a 33MHz 030 because they considered the 16MHz
030 to be more appropriate for a consumer machine - the 33MHz
030 is more expensive and would (probably) also have required
a more expensive design.

I've tried a couple programs, and probably ran into the same error.
However, get a copy of MOUNT IMAGE 1.2 (or similar version). This
is a control panel program which will let you treat the IMAGE file
(which is like a MSA file on the Atari) as its own disk, from where you
can execute the files, etc or better yet copy them from the image to
a floppy for backup purposes. MountImage is available on various
FTP sites (see archie) as well as the Apple download area on GEnie.
Hope this helps (it works on the Apple System Disk images found
at ftp.apple.com as well :-)

So will this allow Spectre users to use standard MS-DOS diskettes
(or ST diskettes)? I have been looking for such a thing for a
while...

Has anyone tried the full version of that program from atari.archive
(I forget the name) which claims to let you transfer disks to and from
Mac format? Can anyone tell me more about macread or macatari, two
programs which were discussed on the German maus.sys.atari groups?
Are there any Mac programs which work with Spectre (not the GCR) which
allow it to use MC-DOS diskettes?

The ideal program would allow Spectre to read and write standard Atari
ST disks _and_ standard Mac disks _without_ the GCR. Can this be
done?

Thanks for any help...

nino> These questions have been discussed to death already in this
nino> newsgroup, but once again:

But it was a DUMB decision! Listen to your customers, Atari!

nino> - SIMMs are too big to fit in the Falcon030 case

So use a different case...

nino> - A detachable keyboard wasn't used according to Atari because
nino> 1) The Mega STe and TT cases were not considered appropriate for
nino> a consumer machine.

But those cases are so great (especially the Mega case)! And they could have used SIMMs! and detachable keyboards. Even Macs (the ultimate expression of consumerism :-) have separate cases, detachable keyboards, and SIMMs nowadays...

nino> - the 33MHz 030 is more expensive and would (probably) also have
nino> required a more expensive design.

I understand this...

now, I'm not yelling at nino, just at Atari for their stupid decisions about the Falcon. I'm a happy Atari owner and have been for years (so don't flame me like some Amigaphile :-) but Atari is just notorious for bad designs.

What I want is this:

A Falcon040 with the DSP, GOOD D/A and A/D, ST compatibility, SCSI 2, VGA, standard serial and parallel ports, RCA in and out for sound (and NO crummy headphone amp), standard SIMMs, a Mega-style case, space inside for an extra hard or floppy drive, a GOOD keyboard...

why can't they do this? It's DAMN close to the Falcon they DID build... Just a little more and they would have had a really winning machine...

Maybe I should just get a TT030...

It's not tumbling. It was around 4 for a while. On both Thursday and Friday,
it went up over 1/2 and ended up at 5 1/4. It's now settling down again.

By the way, does anyone know what cauesd the spurt on Thursday and Friday? I
didn't see any news that should have caused it.

Tom

Mag!X only has one major problem: it can't co-exist with MiNT.
If I have to choose between a fast AES *without* MiNT (Mag!X) and a
slow AES *with* MiNT (MTOS), I'll usually choose the latter.
(Besides, like it or not, it's _THE STANDARD_...)

Mac format? Can anyone tell me more about macread or macatari, two
programs which were discussed on the German maus.sys.atari groups?

I have MacSee, which was touted to be able to translate MAC files to Atari, and
vice-versa, but I think you need Spectre GCR to use it. Also, the transverter
program on Spectre GCR was supposed to do the same thing, but I could never get
it to work. (i know, I know, there are lots of people out there who can get it
to work, but I can tell you from experience and my E-mail that there are plenty
of us who cannot get it to work, particularly on Mega STe and above). Anyway,
my experience with MacSee is that it is a piece of dog doo-doo. I try to save
ASSCI files of Macintosh Microsoft Word to Atari Word Writer, and vice versa,
and it gets screwed up both ways. When I go from Mac to Atari, parts of
sentences get lost. When I go from Atari to Mac, it only takes a single page.
Any more than a page at a time, and crash city. There is also a lot of wierd
machine language that gets stuck onto files both ways, and by the time you
delete that, you may as well have re-typed your document. What I do is use
Spectre GCR when I need a document in MS word, and put it on a floppy and print
it on the Apple LaserWriter at work (usually such a document is work related).
If I need to use my daisy wheel printer at home, I use Word Writer in Atari
mode. I pretty much have given up trying to transvert files.

In fact, that's why I asked! :)

I couldn't figure out how to get that damn elf from firing. I disconnected everything (except the printer obviously :-) to figure out what was going on!

Now can someone tell me more about this gizmo! I assume it's just a connector, ie no "real" parts in it. I further assume that it uses the printer port's native ground and the parallel lines for its data. I further further assume that there is no dangerous voltages (or currents) running around in a printer port and that it would be ok to play around with little wires to see how the joystick thing works by grounding the printer port's pins. I would also assume that this will do no damage to me or the ST and that I could build such a device and live the rest of my life in peace and happiness. Am I assuming too much? :-)

thanks,

.s.

1719. Re: Looking for a LaserJet Printer Driver (GCR)

Newsgroup: comp.sys.atari.st
Date: 1993-07-22 01:15:13 UTC
From: oar@kurp-gw.hut.fi
Message-ID: <OAR.93Jul22011513@kurp-gw.hut.fi>
Source record: 203494
Cross-posted to: comp.sys.mac.misc,comp.sys.mac.system,comp.sys.atari.st

```
We are pleased to announce a new version of HPDJ, version 3.1.
Use the reply address: hpdj-bugs@hut.fi
```

- Outputs neatly to the Hewlett-Packard DeskJet and is compatible with most LaserJets.
- 5 resolutions: 75 dpi, 100 dpi (the one FAX uses, otherwise not a good choice), 150 dpi, 300 dpi, and draft (it uses DeskJet's internal fonts).
- Compatibility with page setups of most Apple and many other printers that are available in 1993. This driver recognizes and tolerates the paper sizes that these printers use. HPDJ can now handle a variable number of "foreign" printer paper sizes and a comprehensive set of paper sizes is readily provided.
- Personal paper sizes.
- Portrait and Landscape printing directions.
- HPDJ reports its progress during printing much in the same way as LaserWriter. (A small dialog box in the upper part of the screen.)
- The HPDJ can take advantage of Color QuickDraw if it is available on your machine. You can instruct HPDJ to pretend to the application that it can print 16 colors although in fact it can output only black and white images. If the "Dither bitmaps" option is set, all bitmaps are dithered and thus color and/or grayscale pixels are approximated with dither patterns.
- HPDJ can "Retain pattern sizes", but for "old-style" 8x8 bit patterns only. Perhaps we might implement "new-style", or, color patterns, too. If we did, this option might as a side effect cause HPDJ to render different solid colors as grayscale patterns everywhere, not just in bitmaps only.
- Bold and underline work in draft output. If you have bought (we haven't) a DeskJet font cartridge for italic output, it should work too. (DeskJet Plus, DeskJet 500, and most of the LaserJets have at least some italic fonts built-in.) You can control how often the print head is repositioned on a document-by-document basis. This repositioning is necessary to achieve a better match between Macintosh and DeskJet fonts, but it consumes more time.
- Support for PrGeneral. This allows an application to find out the resolutions HPDJ is capable of and adjust its behavior accordingly. More and more applications require it (and those who don't, might print more beautifully).
- The printer driver finds out if an operation is allowed on that Macintosh model / system software version and uses only those operations. Thus the printer driver is compatible with System 2.0 onwards.
- Hopefully the driver is 32 bit clean. We have tested it only a little bit (though it didn't show any bad signs). The most of this testing is left to the big public. No dirty operations were knowingly used, though.

Enjoy, have fun,

Olli, Ari
hpdj-bugs@hut.fi

PS. This driver is *freeware*. It is not in the public domain, however:
Copyright (c) Ari Mujunen, Olli Arnberg 1993. Released 15.05.1993.

PPS. There was an error in the HPDJ3.1 documentation. The cable connecting
Mac and HP DeskJet (or in fact the definition of it) had error. A
typo. Here is the correct connection scheme (hope that this time no
typos appear).

```
Mac side HP DeskJet side
4 -+------------------+- 1
8 -+ +- 7
3 ---------------------- 3
2 ---------------------- 20
5 ---------------------- 2
```

The error was that (in the Mac side) number 4 had changed to number 2.

We are sorry for every inconvenience!

Best regards,
Olli Arnberg

It plugged into the parallel printer port (for players 3 and 4). In fact, if you have GAUNTLET II now, every time you want to play it you must disconnect anything attached to your parallel port. Even if your printer is off, the game detects something plugged in and tries to interpret it as player data, which screws up your game if you have an elf who continually runs left and never stops...

Let me try.

>Who will produce Mag!x?

The authors are Andreas Kromke the author of KAOS, and Sven and Wilfried Behne the authors of NVDI (wilfried_behne@h.maus.de).

>When will it be available?

What I have now is said to be the final beta release. So I personally suppose Mag!X 2.0 to be available in August.

>It COMPLETELY replaces TOS? Like, we could remove the ROMs? *grin*

;-) Seriously I had this probleme a short time ago when I garbled one of my for TOS Eproms while patching the TOS. As the system was still able to boot the harddisk and start the first AUTO folder program (heaven know why) but died afterwards, I was lucky having one partition with the magix booter as the first auto start program. Until I got a new Eprom Mag!X was the only operating system available for me. (This resulted somehow in the devellopment of CoNnect ;-)

So - the TOS ROMs are needed to boot up your system...

>And what do you mean it's "nearly" AES 4.0 compatible?

So far Mag!x does not support 3d Buttons which may have resulted out of the common criticism concerning the 3d Buttons here in Germany. There are other functions missing which I'm currently not able to name. For instance appl_ginfo, shel_write, wind_update and lots of other are compatible to the new AES4.0 specs. (The functions needed for a multitasking system are available...)

> -SIMMs are too big to fit in the Falcon030 case

Er... so Atari says...

But according to Mike Olin, the memory expansion upgrade boards they got in
at his Atari dealership DOES use SIMMs, and DOES fit in the Falcon030 case.

(The fact that the upgrades didn't WORK doesn't mean they didn't FIT...)

Just like the ST Book, just because Atari can't do it, doesn't mean it
can't be done.

>ZIP beat it for speed, and efficiency! (ZOO lost again :)

Well, I think you did not read the docs for zoo, it has a high compression mode,
which is off by default for compatibility reasons. When used, it gives as good
compressions as lharc with method lh5 (in fact zoo produces 2 bytes more compressed
output; zoo abd lharc use the same compressor). The speed lost in zoo is due
to being written in C, not assembler, so it is portable.

What makes MiNT so slow is the real slow GEMDOS filesystem, on which MiNT
operates. If you use a faster file system (like the minix fs) mint will gain
a lot of speed. Trust me, the kernel is not so slow as it seems.

And if you have an old TOS you must run compress.ttp througha CLI.
'command.prg' for example. Has something to do with TOS 1 converting
everything you type in a .ttp to upper case letters.

> ultimate expression of consumerism :-) have separate cases, detachable
> keyboards, and SIMMs nowadays...

You're telling me? I've had a Mega STe for 2 1/2 years, and the
keyboard and case are really very good. But, Atari once again made
a bad decision, and thought they could sell a 2400 DM machine as
a consumer machine...

> What I want is this:

Who doesn't... ;-)

> A Falcon040 with the DSP, GOOD D/A and A/D, ST compatibility, SCSI 2,

> inside for an extra hard or floppy drive, a GOOD keyboard...

> why can't they do this? It's DAMN close to the Falcon they DID
> build... Just a little more and they would have had a really winning
> machine...

That would have been the next step I guess. At fairs I was being told
that a 040 based machine was being developed at the same time as the
Falcon 030 - but it seems that either
1) they abandoned that machine because they couldn't even sell/produce
enough 030's.

2) it's still being developed
3) Atari are waiting to sell enough 030's before they release the 040
to the public.

> Maybe I should just get a TT030...

Since they're claiming that the TT030 is being produced again, I suppose
what happened is 1). On the other hand, one of the Tramiels (or
B.Brodie?) said recently that Atari will concentrate on the consumer
market - so the TT030 is probably the last `workstation' class machine
from Atari for a while...

> re: MountImage

>So will this allow Spectre users to use standard MS-DOS diskettes
>(or ST diskettes)? I have been looking for such a thing for a
>while...

No, this particular program is used to handle IMAGE files (like MSA's on the Atari). Two other programs that are supposed to work with these files don't seem to be 100% functional under Spectre (one doesn't recognize the hard drive - thinks it's a disk drive; and the other gives an error when writing to disk). MountImage, however, seems to work fine under Spectre (and I'm using version 2.65/GCR at the moment)...

>Has anyone tried the full version of that program from atari.archive
>(I forget the name) which claims to let you transfer disks to and from
>Mac format? Can anyone tell me more about macread or macatari, two
>programs which were discussed on the German maus.sys.atari groups?

You might be referring to MacSee? I haven't tried this program though...

>Are there any Mac programs which work with Spectre (not the GCR) which
>allow it to use MC-DOS diskettes?

I've used some program at one point that would let Spectre (GCR, and probably just plain Spectre 128) read DOS double-sided disks, provided they had the volume name DEMO or something like that (the program itself was a "demo" version - in order to get more flexibility, etc you would order the full version). There's also "Apple File Exchange" but I haven't tried that one out... (I forget if it comes with the later System versions or if it is a separate product altogether)...

>The ideal program would allow Spectre to read and write standard Atari
>ST disks _and_ standard Mac disks _without_ the GCR. Can this be
>done?

Probably (*anything* can be done, given some ingenuity :-) Probably the best way might be if someone wrote a XFS filesystem to run under MiNT - it would be nice to move between TOS, Minix, and MAC filesystems seamlessly...

To us none Unix people ZOO is a Big Joke, its not that easy to
use with a 520k one drive Atari and it does not archive Empty Folders,
this meens that its not a true Archiver..

The ST version that supports directories is a hack, as its only supported
on the Atari....

ZOO files are baned on Compuserve....

Lets stick with Archivers that work correctly on the Atari and that can be
compatible with the other main PC's...

Roger.............. sheppard_r@kosmos.wcc.govt.nz

mode> writes: Originator: mode@csd4.csd.uwm.edu
mode> I have the source for a program written in C for the PC. Can I
mode> do something with the source to make it run on my ST?

Well, you can compile it! Get Heat n Serve C from the Languages
directory (I think) on atari.archive.umich.edu. It's easy to set up
and use if you have half a clue about using a compiler... And get
Gulam too 'cause it makes working with code easier. It's a CLI (like
csh) with a built-in emacs-like editor...

mode> It is a disk utility...

in this case, you probably can't use your code without some major
modification... If you really want to try, the Abacus book "ST Disk
Drives Inside and Out"" might help...

Far worse ?
5) Atari won't develop anymore computer
6) Atari has been bought by IBM
7) Atari has bought IBM to get OS/2 technology and build a
`real' PC.

Just telling `reality is far worse' is not enough... I know some people have non-disclosure agreements, so they'd better not tell anything at all rather than making us think everything is wrong without knowing exactly what happens.

> You might be referring to MacSee? I haven't tried this program though...

I have checked with Don Bahr on the functionality of MacSee. It is intended to work with an Atari with a high density (1.44) floppy only. It will not work with 800K disks. It allows one to read and write on 1.44M floppies between Atari and Mac formats. (The data only - it does not attempt to do any transformation between specialized file formats (like some of the special word processing formats so will not convert from Atari word processor format x to Mac word processor format y) but will copy a file from an Atari formatted disk to a file on a Mac formatted disk. It does not do the formatting of either disk. They must be preformatted. It will work on HD floppies, Syquests, or hard disks. It, itself, does not require either Spectre or GCR to run.

There you have the low down. If interested, contact Compu-Seller West for a copy or further info. (708)_ 513-5220. Wayne

1747. Happy Ending to Erased Partition!

Newsgroup: comp.sys.atari.st
Date: 1993-07-22 18:15:15 UTC
From: cmedley@wam.umd.edu
Message-ID: <22mlfj$abk@cville-srv.wam.umd.edu>
Source record: 203325
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Earlier this month, I posted asking for help in recovering my D:\
drive which I accidentally deleted with a boneheaded "rm *".

The rm program I used is one of the ones for the Minix filesystem that
also seems to work fine under TOS. I'm not sure what happened, but
the root directory of D:\ was not just deleted with the zero'd FAT
entries and the 0xe5 at the start of each file/folder name, but it
also had zero'd the root directory, and left the files in the subdirectories
completely untouched, since destroying the root unlinked all the rest.

This meant that getting Diamond Edge (Oregon Research) to undelete the
files wasn't possible. So I hunted down a sector editor and found
the excellent program MONOMON.LZH (available at atari.archive.umich.edu) and
I have to say this is the fastest and most comprehensive of the ones I've
tried for this job... it literally can read in and update the display as
quick as I wanted to go when manually hunting the disk for subdirectory
entries. It also had searching and editing capability that were perfect,
as well as the ability to exec another program (which i often did when
trying to fix things... i would exec Diamond Edge to see what the Disk Medic
said about my edited changes to the drive).

The gist of the story is that once I put in a fake deleted entry for the
subdirectory i wanted to recover, and fooled Diamond Edge, it recovered
everything else just as advertised. I'm now using Diamond Edge's "mirror"
option just to be safe. :) $50 well spent on Diamond Edge.

(if i can find out if the author of Monomon is still taking shareware fees,
i'm going to send him a nice shareware fee and a big thank you for his
program)

|> Maybe I should just get a TT030...
|>
Maybe you should. Maybe if they had sold more TT030s they would have seen enough demand and a market for a higher speed, two piece machine. As it is, they probably saw that the TT030 didn't sell all that well to the average consumer and thought it was a good idea to keep costs as low as they could with an ST style machine. I know the price isn't all that cheap (of the Falcon), but we must keep in mind that Atari just does not have the manufacturing or marketing resources to keep costs as low as in the clone market.

Below is the message I posted several days ago to which I have had very limited responses. I HAVE to sell this stuff within 2 weeks before I move!! Here's what I'm going to do: make me an offer on the package - if one person offers me $200 and nobody else tops that - they get it.
^
| arbitrarily chosen figure

I really really really really need to sell it as a package. I don't have the time to parcel everything out - unless I absolutely have to. So why not make an offer for the entire thing? Give it as a gift, anything, but please buy it! Everything is in good condition with one or two MINOR quirks - i.e. the built in drive's eject button doesn't like to stay in when you eject a disk. I would like to get at least $800 for everything, but I'm willing to entertain any offer.... 'nuf said.

****

****** $900 ********
****** $900 ********

I'm selling all of my ST equipment for the price listed at the top of this message, $900 dollars. Please buy it!! I've grduated from school, and due to work I've had to get an MS-Dos notebook instead (for what it's worth, I prefer the ST - more intuitive and fun to use...sigh). I am only interested in selling everything as a package, primarily because I do not have the time to start splitting everything up. On the off chance that you want a specific item, send me a bid. I will only consider giving a really good deal to someone who either buys the entire setup, or at least a large chunk. Here goes:

*** Mega ST2 (includes all upgrades listed)
- nice design, comfortable external keyboard, has room on the motherboard to easily be upgraded to 4 meg

- MIDI ports

- TWEETY board installed (splits the ST's sound output into 2 channels to be played through your stereo)

- SWITCHABLE TOS 1.2/2.06 (the newest TOS, I installed the switch myself; it allows you to have complete compatability with any software by choosing the operating system it's most compatible with. 2.06 is extremely fast and has TONS of features - nicer to use than macs or windows IMHO)

- all the usual ports- parallel, serial, hard drive, 2nd floppy,
monitor, etc.

- golden image mouse

- extra atari mouse

- Warp 9 registered & installed

**20 meg hard drive

**SC1224 Color Monitor
- will accept either 60 or 50 hertz sinc

**SM124 Mono Monitor
- internally adjusted for maximum screen size

**2400 baud modem & software

**external DS/DD floppy

**Epson LQ-850 high speed 24 pin printer (needs ribbon)

**Navarone Video Digitizer

**Monitor Master

**Mouse Master

**software:
|
- I have a ton of stuff, almost everything you could ever need/want
word processing, telecomm, dtp, programming, graphics, music, a *TON*
of games.

I have *** 335 *** disks of software. Plus an additional 40 or so
blanks.

All appropriate cables, power supplies, and manuals are
included. All of the equipment is in extremely good condition.
Everything is clean and has been VERY well kept.

- I also have some of the boxes for the hardware (computer & 1
monitor I think.

****
Total cost $4,000 +
****
******
I will sell it all for $900 <---- (that's a good deal)
******

plus shipping (or will deliver within 2 hour driving time of Buffalo, NY)

If you are interested in what I've got, E-mail me at this account. I log
in daily..

Hey!! BART hasn't been working for me either. What's up? I've been trying to get the MiNT version of GCC 2.4.2, but now it seems that there has already been an upgrade and BART still hasn't given me my files. I got 1 message about not being able to send the files for 3 days, and I sent another request for them, but haven't recieved anything.

Does anyone know what's up?

My current version of GCC got corrupted so its only half working, and I need the new versio.

1753. Speedo Gdos questions

Newsgroup: comp.sys.atari.st
Date: 1993-07-22 21:22:11 UTC
From: elvis@watserv.ucr.edu
Message-ID: <34511@galaxy.ucr.edu>
Source record: 203335

Hi,
I recetly got Speedo Gdos from Compo, and was wondering if others who have Speedo could answer a few questions. I've used it with both an HP LaserJet and an Epson 24 pin printer. It looked extremely nice on the HP, but the letters came out about twice as wide, and very bold, on the Epson, to the point that they smeared as the print head moved away. Has anyone else had this experience with a 24 pin printer? When I used regular Gdos fonts, the Epson produced fairly nice characters, but it seems like Speedo will not print thin lines on it (larger sizes look fine, are the right thickness, etc.) Is it a problem with the printer driver? Or is it that scalable fonts are primarily designed for use with Laser Printers, and a 24 pin printer just isn't up to it?
My other option (as I doubt that replacement printer drivers will be available soon, if that is even the problem) is to get an ink/bubble jet printer (can't quite afford a laser). Does anyone have experience with using Speedo with either a DeskJet 500 or a BubbleJet 200 (emulates a 10e)? Does the output match (or at least come close to) a Laser Printer? Is it at least of normal proportions? I'm leaning towards the BubbleJet (kinda looks like a Stylewriter) because with the rebate its about $285, as opposed to about $350 for the HP. Unfortunately, the driver for the 10e only does manual feed (even though you can get paper feeders for it). Is there any way to edit the drivers for Speedo? They are all the same size, so it seems like they must be set up in a similar fashion. Could it be a matter of turning on a flag in the file? Or would I simply have to hope that Atari comes out with a new driver that supports a paper tray?
One last question... how long does it take for Speedo fonts to load normally? On my system, any application that uses Gdos/Speedo fonts seems to take at least a minute longer to load, whereas a friend of mine claims that on his system there's no noticable time difference when using Speedo. I have a plain old ST, while he has an STE, but I don't imagine that could be making too much of a difference, especially as mine is upgraded to 16MHz. Can anyone think of what might contribute to such a big difference in time for loading the fonts? (I think my hard drive is faster than his as well, so it can't simply be time for reading the files...)

Any help for my ramblings would be greatly appreciated.

Thanks,
Andrew Cullum (elvis@watserv.ucr.edu)

I have a 550C and the printouts look beautiful from Works, which is the
only thing I have been using with Speedo. There is no driver for the
550C but the 500 works. They do have a driver for the previous color
printer, (180 X 180), but I haven't been able to print anything in color
yet from the Atari. The color works, I got it from the test pattern.

I hope a 500C driver is forthcoming... I am going to check out the
paint programs for printer support in color, that is what I want it
most, is for making fliers.

I do have a screendump program I got from FTP for the color HP printer,
it works but doesn't print color.

One problem I have with the Deskjet is not with Speedo but with Dr. T's
DTP. The character spacing is not as it appears on the edit screen.
Typically you have to mix music symbols with text, i.e. for chord
changes, and the changes come out on the wrong measure.
If I do the fast screen dump, it is ok. I am going to call Dr. T's
tomorrow.

> One last question... how long does it take for Speedo fonts to load
>normally? On my system, any application that uses Gdos/Speedo fonts seems to

Whenever I get a message about loading fonts, or downloading fonts, it
is always very brief. I never used Gdos when I had my Mega, with
the Falcon, you get Speedo. So I have nothing to compare it with.
I must say I am very impressed with it. I was amazed how well the
scalable fonts worked with my lowly Epson.

They didn't want to sell the TT030 in large numbers. Just make enough to satisfy those few who would use them, and concentrate on developing other machines. Use of the 68030 prepared Atari to develop other 68030 machines, like the Falcon. Without the theoretical bridge of the TT030, very few would have written resolution-independent and 030-capable code.

Why make large numbers of TT030s? No one was going to buy them, and the majority of the dealers out there weren't qualified anyway. They didn't know enough about STs, not to mention the TT030.

Sure, the TT is a great computer. I have one, and would get another. But that doesn't mean others would buy them. The TT is a tougher sell than the Falcon, because Atari has to go up against the large base of clones and Macs, without a large number of dealers.

[New this time: Unnkulia Zero is now available for Macintoshes!]

The Unnkulian Unventure Series
Adventure Games for the 90's

Remember the good old days, when adventure games challenged you with great puzzles and evocative descriptions without resorting to any graphics at all? We really miss that emphasis on gameplay rather than glitz, so we've decided to write our own adventure games along the lines of the early text games we liked so much.

If you're looking for top-quality interactive fiction comparable to 1980's commercial offerings, check out the Unnkulian Unventure series, available from an archive site near you!

In _Unnkulian Underworld: The Unknown Unventure_ you play the part of Kuulest's slave, and must recover the Orb of Studosity from the evil Unnkulians. Kuulest, the old geezebag, has died and left you with nothing to go on but a cryptic message about saving the planet. You'll encounter amazing Acme products, the infamous Guardian, those witty creatures known as Drolls, a giant beaver, and even the Dread Unnkulian Warrior. <Gasp!>

In _Unnkulian Unventure II: The Secret of Acme_ your adventure continues as you try to create some good press for yourself -- wouldn't want to fade into anonymous obscurity, now would you? Along the way, you'll find the answers to these compelling questions, and more:

o What happened to the Unnkulians?
o Why are Acme products so bad?
o What is this cheez stuff, really?

Plus, you'll get to explore Dawg Rock, a Duhdist Retreat, Acme's clandestine prototypes laboratory, and even pay a visit to Acme HQ.

In _Unnkulia One-Half: The Salesman Triumphant_, you'll play the role of a down-and-out Acme salesman, forced to work out of the Golden Dragon Inn, dangerously near Dread Unnkulia. Will you accumulate enough loot in this frightful backwater berg to turn your fortunes in your favor?

And, in _Unnkulia Zero: The Search for Amanda_, will you, the Valley King's most trusted warrior, rescue his Lady Amanda from the gruesome clutches of the evil Unnkulians?

Along the way to victory (or, <shudder>, defeat!), you will:

o Find out about the ancient days of the Valley,
o Meet the King's faithful (but not so bright) Valley Patrol,
o Explore *beautiful* Lake Draounheer,
o Discover the ancient burial ground of your ancestors,
o Become frustrated with the pesky Stoll and his Stoll Bridge,

and, of course,

o Meet that wondrously wacky Wowsa Willy!

The Unnkulian Unventures have already gotten rave reviews from numerous adventure game connoisseurs around the world, so why not give them a try?

The games are available for FTP from the if-archive at ftp.gmd.de.
(Note that the site wuarchive.wustl.edu keeps a mirror of the if-archive in the mirrors directory.)

PC and compatibles (running DOS):
---

if-archive/games/adventions/pc/unnk1v30.zip

if-archive/games/adventions/pc/unnkhz10.zip

Macintosh:
---

if-archive/games/adventions/mac/unnk1v30.sit.bin
if-archive/games/adventions/mac/unnk2v30.sit.bin
if-archive/games/adventions/mac/unnkhz10.sit.bin

(These are MacBinary files.)

if-archive/games/adventions/mac/unnk1v30.sit.hqx
if-archive/games/adventions/mac/unnk2v30.sit.hqx
if-archive/games/adventions/mac/unnkhz10.sit.hqx

(These are Binhexed Stuffit 1.5.1 files.)

Others:

TADS now runs on lots of different systems. Because of this, we have TADS .GAM-file only archives that can be used with any machine that runs TADS. The tricky bit is that before you can play the games, you need to get the TADS run-time for your machine.

Fortunately, this isn't hard to do. Just grab the TADS executable package for your machine from the if-archive:

Atari ST/TT/Falcon:

if-archive/programming/tads/atari.tads2exe.arc

Sun Sparcstation (SunOS):

if-archive/programming/tads/sparc.tads2exe.tar.Z

Sun 3:

if-archive/programming/tads/sun3.tads2exe.tar.Z

DECstation (MIPS) running Ultrix:

if-archive/programming/tads/decmips.tads2exe.tar.Z

SGI (Iris/Indigo) running Irix:

if-archive/programming/tads/sgi-irix.tads2exe.tar.Z

Linux (386):

if-archive/programming/tads/linux.tads2exe.tar.Z

NeXT:

if-archive/programming/tads/NeXT.tads2exe.tar.Z

Amiga, other Unix:

In the works!

Once you have TADS running on your system, you can get the games:

if-archive/games/adventions/others/uu1v301.tar.Z
if-archive/games/adventions/others/uu2v30.tar.Z
if-archive/games/adventions/others/unnkhz10.tar.Z

The file How-To-Run-These-Games in the same directory gives
your more information.

NOTE:

The source to TADS 2 is not distributable. However, if your
machine isn't on the list yet, and you would like to volunteer
to port TADS 2 to it, send email about it to Mike Roberts
<mroberts@hinrg.starconn.com>. Porting to Unix-like systems is
fairly trivial.

Unnkulian Unventures I and II are shareware ($10 registration fee
each); registering gets you spiffy maps and agony-sparing hint sheets.

Unnkulia One-Half is free -- don't pay us for it!

Unnkulia Zero is US$25 and is available via mail order from ADVENTIONS
or via phone (credit card order) through High Energy Software.
Unnkulia One-Half comes with a playable demo of Unnkulia Zero, which
includes information on how to order the complete version.

Happy adventioning!

Dave Baggett
ADVENTIONS

Internet: dmb@ai.mit.edu
Compuserve: 76440,2671
GEnie: ADVENTIONS

A Word About TADS

We at ADVENTIONS use a programming language called TADS to write our games. TADS is a product of High Energy Software, and you can get it via FTP.

TADS (and TADS goodies) are available for many systems from ftp.gmd.de. Look in the if-archive/programming/tads directory.

TADS is also shareware, and we strongly encourage you to register it if you use it, since we feel it is a powerful, innovative, and very inexpensive development system that deserves to be paid for.

Well, i'd already committed to purchasing DiamondEdge... and as for the
Mirror program, that would do me no good since I had not mirrored the
drive before the deletion. So I had to rely on DiamondEdge and Monomon.

I didn't try checkdisk 3 mainly because i got progress out of the other
two so quickly....

1768. AtariWorks on TOS 1.0/1.02 -- NOT!

Newsgroup: comp.sys.atari.st
Date: 1993-07-23 05:24:12 UTC
From: molin@ptb.cl.msu.edu
Message-ID: <22nsls$ou1@msuinfo.cl.msu.edu>
Source record: 203344

Have heard from a person who bought Works that it absolutely would not work on his Mega 2 (TOS 1.02 machine...) After several attempts to help him over the phone, he finally called me to tell me he had talked to Atari directly and they reportedly told him that Works does not work on pre-TOS 1.04 machines... Said something about a patch file on GEnie, but offered him no way to get the file directly from them. (He doesn't have a GEnie account, or a modem.) Seems the problem is in the dictionary/thesaurus and the temporary solution is to delete them from the Works folder.

Well, I am planning during the end of the summer to write an Appletalk
interface for the Falcon/Mega STE/TT, a sorta Mac LAN selector, with
file sharing and printing capabilities.
I wonder if there are anybody interested in it, since I am looking for
people to do beta-testings. If you are, send me some email !
(elendir@enst.fr)

The final release would be freeware anyway.

V.

1776. (A) First Word + => RTF

Newsgroup: comp.sys.atari.st
Date: 1993-07-23 08:57:08 UTC
From: js@let.ruu.nl
Message-ID: <1993Jul23.085708.5557@let.ruu.nl>
Source record: 203405

There was some talk going on here on the subject of converting First Word Plus files to Microsoft Word for Windows. I had written a tool to convert WordPlus to Rich Text Format as a general-purpose converter; RTF is a native NeXT format, there are many RTF interpreters available - and one of these is MS Word for both Macintosh and Windoze.
There are some problems with it though, some of which I think I failed to document properly (well, maybe I did, but forgot I did).

This leads to a question - does there exist a exact and detailed description of the First Word Plus file format?

Follows the description of the problem with 1wp2rtf (or what *did* I call it):

| I used your great Tool 1wp2rtf to convert Atari-Files to RTF-Format.
| These I intented to import into Word for Windows, but there is only
| a part of all the text imported. The rest is missing without any reason

Nothing, really. There are bugs in the program: because I never could lay my hands on an accurate description of the First Word Plus file format. I had to reverse-engineer it.

Sometimes in a WordPlus document character sequences appear (for that reason) that make my converter think some attribute is cancelled (thus leading to the insertion of a '}' character) when in fact this is wrong. I recall most of these things had to do with W+'s pagination combined with footnotes.

To solve it, just open the hqx file as text, and look for the point up to where interpretation was successful. At that point, a spurious '}' occurs, with the effect of marking the end of the document in the RTF format. Remove it, save as text, interpret the document again.

Repeat this procedure until you've got it all.

To us MiNT people LHARC,ARC,ZIP are a Big Joke, they do not work with
minixfs and other file systems with long file names, they munch up
text files by sprinkling those ugly CR's into them and do not preserve
file modes. The only true archiver is tar+gzip. This beats everything
by speed and size. Why sticking with compatibility with PC's if there
are far superior tools?!

Hello,

lps110 has the ability to replay *.AU, *.WAV, *.AVR and all kind of hederless
soundfiles without converting them. Unknown formats are handled like
headerless. There is an algorithmn to check these headerless sounds in
order to replay them correct.
The length of the sound file is not limited; works ALSO with MiNT!

You can find it at:
ftp.uni-erlangen.de in /pub/atari/sound/ called lps110.lzh
ftp.uni-paderborn.de in /pub/atari/tools/sound/ called lps110.lzh
atari.archive.umich.edu in /atari/Sound/Players/ called lps110.lzh

Bye Uwe.

Source record: 203408

Hi!

I'm looking for some precise Jaguar-Specs like
- The speed of the RISC-main-processor (MHz)
- The speed of the DSP
- The resolution(s)
- The sound-system
- The rumour stating that an 68000 is the "real" mainprocessor
- The 2D-hardware: Number of Sprites, Scrolling...
- The 3D-hardware: Vector-graphics, Texture-mapping...
- The number of Joypads that can be attached to the Jag (2, 4?)

I'd be glad if some of the questions will be answered...

Thanx
Felix

It is the parrallel/printer port (which can be used as an input
port on ST): no extra hardware needed but the right cable.
Sorry but I am at work just now and I don't remember the exact wiring.
I only remember that one joystick uses 4 of the 8 data bits plus STROBE
for the fire button, and the other uses the 4 other data bits plus ACK
(and don't forget GROUND).
I have it installed at home and it works with Gauntlet II and a couple of
other games.

> >Who said anything about Hard-Drive?
>
> You don't have to wait a long time. It's still much faster to load a
> packed program from a hard drive than to load it *unpacked* from a
> floppy. Try it.

Oops, you misunderstood... I meant I'd rather have this sequence:

1) run program
2) program loads
3) program is usable

instead of:

1) run packed program
2) packed program loads
3) program spends n seconds unpacking (where n > a reasonable amount for
large programs, of which I have many)
4) program is usable

Now, on _floppies_, the major speed hit is the pathetic access time, so
it's actually faster to do it the 2nd way (ie, load the packed program).
There's probably a "critical mass" size for large programs on floppies
where a file larger than that is faster to leave uncompressed...

Gee what a hellish sentence that was. :)

But this upgrade now does!! Here is an extract from the new
BFRD.DOC file:

talking about the previous submission BFRDBU.PRG ....
! " - and during the past few years, has saved me a great deal of
!trouble, alas on several occasions. The current offering, BU_BFRD.PRG
!& RES_BFRD.PRG, is an upgrade on that in the sense that in the tiny
!BACKUP_ONLY program, BU_BFRD.PRG, I have implemented the "quick"
!cyclic backing of all partitions on "other" partitions (see below)
!that I mentioned in the documentation (BFRDBU.DOC) that accompanied
!the earlier version and which, indeed, I first thought of when writing
!that DOC. This improvement reduced the total time to back-up ALL
!partitions on my 105 Mbyte Hard Disk to only 9 secs from the 65 secs
!or so it took to back them onto floppy. Of course, this program is
!ideal as an AUTO-folder back-up program (it uses no GEM). "

Good Luck,
W. Alan B. Evans. July 1993.

From the Holy Book of <22m0jbINNg8l@golem.wcc.govt.nz>
as spake by sheppard_r@kosmos.wcc.govt.nz :

>To us none Unix people ZOO is a Big Joke,

Oh gods, not again...

> its not that easy to
>use with a 520k one drive Atari

And similarly, System 7 (or even most versions of System 6) is not that easy to use on a Mac 512K with a single 400K floppy drive. What's your point?

> and it does not archive Empty Folders,

Why on _earth_ would you want to do this?

>this meens that its not a true Archiver..

Mm-hmm. And LHarc is? Unfriendly with MiNT, doesn't support long or mixed-case filenames, doesn't support file modes... A lot of people would laugh if you tried to call that a "true Archiver".

>The ST version that supports directories is a hack, as its only supported
>on the Atari....

But if you're only going to use it on the Atari, Roger, why does that matter? ;)

And besides, that statement is misleading. The Atari Zoo recursive subdirectory add (which is the _only_ part specific to the Atari, BTW -- in general, Zoo handles directories quite well, better even than LHarc) creates archives which are entirely compatible with all other versions of Zoo. Off the Atari, there are other methods for making Zoo do a recursive subdirectory add (the 'find ... | zoo aI...' trick, for instance); personally, I think the a// is conceptually cleaner, and I hope to see it merged with the full source in the next release of Zoo.

>ZOO files are baned on Compuserve....

Your point?

>Lets stick with Archivers that work correctly on the Atari

Zoo works perfectly on the Atari. LHarc I still have doubts about.

> and that can be
>compatible with the other main PC's...

Zoo works perfectly on PC's. I've used it there myself with no
trouble.

And I'm shocked at you, Roger, for suggesting that these files should
move anywhere but between Ataris. After all, only "Unix freeks" would
want to manipulate their archives somewhere else, right? ;)

>Roger..... sheppard_r@kosmos.wcc.govt.nz

I'm beginning to suspect this is some kind of religion with you, Roger.
I use Zoo regularly and have never had problems with it. I've used
Lharc fairly regularly, too, and have had problems as often as not. For
me, the choice is simple.

! where a file larger than that is faster to leave uncompressed...
!
I don't see why. It would seem to me that both the time it
takes to load a file off a floppy and the time it takes to unpack scale
linearly with file size. So if the unpacking rate is faster than the
floppy load rate it is always better to pack irrespective of program
size. Or am I missing something?

As for various packers' unpacking rates, I find it's hard to
beat PFXPAK (anyone found otherwise?).

>

What's the stock market philosophy? Buy the news, sell the rumor? Or
something like that? The big upthrust was due to the announcment of
a) Jaguar, and b) IBM manufacturing. Once the initial glow wears off,
all the speculators go away and wait for _more_ news.

IMHO the stock price will continue to drift down for another month or
so, and I'll probably buy back what I sold at 5 in time for the next
rally. (No, I did not sell *all* of my Atari! Just enough to pay off
my initial investment at 1....).

On a floppy? No way. It's always faster to load a packed file (PFXed). On
a Falcon this also applies to the HD. Compressed files take the same or
less time to load. Give PFX a try - it's different.

I've had it for several years now and I can not use an ST without it. It does not interfer with any memory upgrades since is resides only in the processor socket. I did have to put a notch in my RF shield to get it to fit. Also there is a special version of AdSpeed for the STe.

To install it you remove the existing 68000, plug in the AdSpeed ST, and set the jumper for the machine to boot in 8 or 16Mhz mode. I set this for 8 for the occassional game :) Add a program to your auto folder to switch to 16 Mhz and away you go.

A word of warning the supplied accessory to switch cpu speeds caused WORDUP 3.0 to religiously produce 10 bombs. The only time I use 8Mhz is playing games so this is Ok. Use with Spectre and 2.5 megs of memory requires a special workaround to be able to use at 16Mhz.

I use an ADSpeed on a Mega2 and it makes a big difference. I am able to run without a screen accelerator (TurboST is what I normally use) and it is as good as 8MHz with TurbST. Also makes other (non-display) tasks run faster too. It has been very solid since I put it in and I don't have hardly any compatibility problems (I don't play many games).

Also, just received a mailing from ICD and they are having a summer sale and offering the ADSpeed for $99.00! Wish I had come across a deal like this when I was looking. At that price it is certainly worth it.

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Has anyone tried to rig up the software & hardware necessary to use ST floppy drives on the Atari 8 bit computers? It would be great to be able to use the extra disk storage, and it would be ideal if the file systems were compatible, so we could share files between the machines.

So, has anyone done this?

I don't have time to hack on this project now, but might look into it in a few months. Any particular trouble points to watch out for?

You forgot support of MiNT calls, since any developer writting for MTOS
is going to like MiNT calls. Just a few can add some nice flexibility
to things! Not to mention that the MTOS drag-n-drop requires a MiNT
pipe!!

Also, making an application sleep is not new to GENEVA. MTOS has this
because MiNT has it. With text based applications its CNTRL-Z, with others
you can send a signal, and I think there MIGHT be an ALT-CNTRL-Z.

The windows may not automatically close, but the process stops using CPU time
Also, changing priorities is pretty easy with MiNT/MTOS and MiNT/GENEVA.
I actually run GCC in th background for small programs, and pther compilers
could easily be used in the background.

>
>Ulrich
>

What!?!>? This is complete and total BS. The Minix File System is MUCH slower than the FAT file system. And that only affects disk access, and most MiNT calls and the multitasking do NOT access the file system. However, MiNT slows the machine down by about 1 or 2%, about the same as Warp9.

We used to have a text file on atari.archive describing how to build this adapter, but it seems to have vanished. I can't seem to find it anywhere in my private backups either, but the docs have been around for a while. I made one a while back, just needed a DB-25, 2 DB-9s, and some wire...

I put one into my 4160 STe, no real compatibility problems. Some software refuses to run at 16 MHz, but you can set it back to 8 in those cases and everything is fine. (Most notably, Notator/Creator. Big drag...) The cache can only help so much; generally you'll see a 30% speedup. The only time you'll see a full 100% speedup is when you're running a very tiny piece of code that doesn't manipulate very much data. (Not often.)

1798. 1040STe - now what do I do?

Newsgroup: comp.sys.atari.st
Date: 1993-07-23 20:52:24 UTC
From: DBRIGHAM@nsf.gov
Message-ID: <DBRIGHAM.14.743460744@nsf.gov>
Source record: 203420

OK, I just received a 1040STe from one of us fine ST using Interneters, and it seems a might better than my old faithful TOS 1.0 1040STf. I received it with an AdSCSI Plus ST hard disk interface. I've got a couple of questions:

TOS version - when I look at the Info screen it has the 'Rainbow' TOS display, what version would this be? What utility do I need to check?

I have a VideoKey I have used with my 1040STf - it's one of those ST Monitor Port -to- Composite/Modulated video converters, and it works fine on my 1040STf. But it doesn't do anything when connected to the STe - I thought the monitor port outputs were the same? There must be some active line the box monitors because the power LED only comes on when the 1040STf is powered up, but it never comes on when the 1040STe is powered up. I did find the RF output of the STe OK, but I'd like access to the Composite output, anyone know where I can find the right adapter cable to pull it from the Monitor port?

OK, now I have this AdSCSI hard drive adapter - what are some good recommendations for SCSI drives which should 'plug-and-play' with it? And what version of the ICD utilities should I be using/where can I get them?

Oh, there is a little printed warning from Atari that there is a special program STE_FIX.PRG in the AUTO folder of the Langauge Disk which "must" be used whenever booting up - what the heck is that? What needs to be fixed? I think the previous owner mentioned he had the TOS upgraded, might this have been a problem with TOS 1.4 that was later fixed?

Finally, once I plunk 4MB RAM in this thing and add a decent sized hard disk (and pay $450 to upgrade to Notator Logic) is there anything else besides MIDI that I can really do with this - needles to say my 1040STf has been gathering dust the last few years except for occasional battles with Empire Strikes Back....

Thanx....

What is this ATARI UNITED! thing?

When ATARI UNITED! was first announced in an online conference on DELPHI, some DELPHI members had questions, which I'm sure others share, about the intent, focus and reasoning behind ATARI UNITED!. A bit of history about the development of this organization might help begin to answer those questions.

ATARI UNITED! was born out of the suspicion that more Atari TOS computer owners exist than most in the active Atari community realize. Patti and I have both had many experiences in which we have come into contact with owners who had no idea that a thriving Atari community still existed. We have both been responsible for bringing ST owners 'out-of-the-closet' and renewing their use of their machines. And, of course, with every renewed Atari owner comes some degree of new spending on equipment and/or software.

ATARI UNITED! has been organized with the intent of searching out these isolated owners on a nationwide scale, with the hope that these users will expand the active userbase. And as a result will promote new business for our loyal developers. ATARI UNITED! seeks to repair the disintegration of communication between users and developers in the Atari market, especially because of the demise of many printed Atari-specific magazines that all too often are an owner's only link to the community.

A late night conversation about the dismal state of the Atari market in the US led to a discussion about ways that it could be improved, independent of direct Atari Corporation involvement. Obviously, we concluded that the creation of a nationwide database containing information about users, dealers and developers was the first step in rebuilding the lost lines of communication. This has become the first priority of our fledgling organization. While it is being compiled, other projects are and will be developed, so that our database can be utilized to its full extent when more complete.

Atari user groups have always been a valuable means of keeping the Atari community together, and it was obvious that user groups were the best place to begin compiling information. Bob Brodie, Director of Communication for Atari Corporation, and former User Group Coordinator, was contacted, provided an outline of our purpose and plan of action, and asked for a list of user groups that could be used in the effort. He was happy to provide us with the necessary information, and so, the work began.

The name ATARI UNITED! was chosen, and again, Bob Brodie was contacted. Permission to use Atari's name was granted, so long as the organization was used to support Atari products and their users. As this was the very foundation of the organization, an informal agreement was quickly reached, and ATARI UNITED! became our offical name. It was further determined that AU! should be a not-for-profit organization, similar to the general form that Atari user groups have taken over the years. ATARI UNITED! does not exist to bilk Atari users out of their money. Actually, we'd prefer that their money be invested in hardware and software, so our loyal developers can make a living. We intend to make all ATARI UNITED! services and projects as affordable as possible. Registration is free of course, and many of the other benefits we will be able to provide will be free of cost to the user also.

ATARI UNITED!'s first project beyond the database is a quarterly DiskMagazine. It will be geared to provide developer news, product reviews, game hints, help columns, and a few surprises. Eventually, program demos might be included, so a taste of what is up and coming can be given as wide an audience as possible. While similar things are now available in the online magazines, it is important to realize that most of the Atari community members are not 'modemized', and that many TOS computer owners have no real link with the rest of the market. So, it is not so much a matter of duplicating what already exists, as a matter of distribution where that kind of information is so desperately needed. Kinda like being modern technological missionaries!

The potential for ATARI UNITED! is enormous, for both the developers and the owners of TOS computers. With better channels of communication, developers will be able to sell more products, encouraging them to continue investing in the TOS market. We, as users, will continue to be able to purchase new products, and find support for the old.

One particular benefit for user groups will grow as the database of TOS computer owners grows. User groups who register with ATARI UNITED! will have their contact information made available to anyone who inquires about TOS support in their area. User groups will also periodically be given access to information about local users contacted by us. Just as the developer and the user can be connected, so too can user groups and users. It's all a part of strengthening the communication channels throughout the entire market.

In addition to communication between groups and owners, we can also help on the individual level. When an owner has a problem with his/her system, or with a piece of software, it is often helpful to contact someone nearby with the knowledge to solve the problem. Even if a user doesn't have a 'problem' per se, the exchange of information and ideas can only benefit the community.

Some users are lucky enough to have a local dealer, but for many, 'local' is a term that can mean several hundred miles. All of those in that predicament will be able to locate owners nearby. Just consider us a friendly dating service for your Atari computer!

Some of our future projects are not far enough along to be openly discussed, but there are some exciting possibilities out there. It is important that we don't take on too much too quickly, only to find that we can't handle our first priorities. Too often a well-intentioned enterprise fails while trying to do too much all at once. Instead, we want to grow slowly with the aid and support of everyone involved in the Atari community. With this in mind, the number of staff at ATARI UNITED! is being kept very small. We have received many offers from users volunteering to help with our project, and we are encouraged by all the offers. But in these early stages, it is essential that our focus be maintained. Too many people with too many ideas would only serve to dilute our efforts at this point. However, as we grow, we will be adding to our little group, to better serve the Atari community.

ATARI UNITED! intends to succeed in its effort to strengthen the Atari community. Time and money have already been expended to that end, and we are fully ready to expend more. But, it'll take the cooperation and support of TOS computer owners all across the US to make ATARI UNITED! the best it can be. To help us help all of you, register now, while you are thinking about it!
Together, we will make the Atari community stronger!

I like this idea of organizing an active user base to encourage support from developers, and to support sharing of ideas and information.

It would be nice if this infrastructure could also be set up to include the 8-bit Atari users as well, assuming there was interest from that community.

From: azog@world.std.com
Message-ID: <CAnBsu.Gxt@world.std.com>
Source record: 203427

Anyone know of a good -windowed- shell thatll run under MTOS?
When running MiNT on my STe, I would run bash in a TOSWIN
window, but under MTOS, it doesnt work good. Apperently,
either it wants the whole screen, or something. The same
with Gulam. They work OK if I run them outside of MTOS.

Thanx

1805. Got my Falcon 14/80

Newsgroup: comp.sys.atari.st
Date: 1993-07-24 03:39:21 UTC
From: saj@chinet.chinet.com
Message-ID: <CAnGtM.7Mo@chinet.chinet.com>
Source record: 203437

Remember me? I ordered a 14/65 Falcon on May 1? Well I just got it (with the 80 M disk). I swear, even in the 16-bit color modes the video is faster than on the demo unit at my dealer. Sure the demo machines were the final model...anything you say. I can get all the regular video modes on my old Thomson Ultrascan (a massively over-designed multisync type), although the colors tend to look a bit funny. Soon's the dealer made up the cable, my Wren hard disk ran fine on the SCSI line. The BMS / Beckemeyer tape backup doesn't seem to work, but I have hopes. I agree that the keys don't feel satisfying. Be a long time 'til I really know the machine.

: Just curious what you are running it on and how much memory you have and is left
: one all the software is loaded?

Hmmm, that's hard to answer. I've got loads of TSR's loading. I have a Mega
ST4 with TOS 1.4. I normally have about 2.5 MB free from the neodesk desktop.
Geneva is supposed to only take about 130KB. On my bootup I have warp9,
speedo gdos, geneva, neodesk, 128KB of printspooler, edhak 3.01, neocontrol,
the two speedo utilities, multifile and probably a couple of other things...

I would say that 60-70% speed up is a more realistic figure. Highly
recommended, especially if you want to run MTOS. As an example, compiling
the same program took me 60 seconds at 8MHz and 39sec at 16MHz.

Source record: 203439

Hi Dana..

TOS's STE's have 1.6 or 1.62...NOT Rainbow TOS..

Rainbow TOS is TOS 1.4, was fitted to some of the later STFM's and Megas, and sold as a upgrade.

STE_FIX is for TOS 1.6 as it will not boot up in medium resolution...

Hard disk, I do suggest a Quantum LPS240S or a LPS105S if the other is to big..

The one big main thing is to find what TOS version you have..??

If you can look at memory is the 2nd and third byte from E00000 on a STE or the same but from FC0000 on a STF or M ...

Roger.............. sheppard_r@kosmos.wcc.govt.nz

1814. Where's Jim Allan (FAST Technologies)

Newsgroup: comp.sys.atari.st

On Dec 5, 1992 I issued a certified cheque to FAST Technologies for a T25 accelerator board. It's now July 24th, 1993 and still no T25! Repeated requests have been made for the product (always got an answering machine - never was able to speak to a person). This morning I called and could not even get the answering machine.

Has Jim Allan taken flight with my $US 285.00? Anyone know where I can reach Jim. I am getting a little bit ticked off at this nonsense.

Jim, if you're out there I want a full refund. Enough is enough!

If Apple can provide A Centris 610, LCIII and IIVX for $1300 and all come with expandability and separate keyboards and faster processors why can't Atari. I remember A Mac plus use to cost $2600 and the 1040 St for $999. What ever happened to power with out the price? Today the Falcon should cost $700 with harddrive since it would be half the cost of a Mac. I would not spend any more than that because of the poor support Atari provides...

1825. GEMBench v3

Newsgroup: comp.sys.atari.st
Date: 1993-07-24 20:51:45 UTC
From: ogal@cix.compulink.co.uk
Message-ID: <memo.474708@cix.compulink.co.uk>
Source record: 203232

I have just uploaded the new version of GEMBench to binaries. Here's a description of the new features.

GEMBENCH v3 - New Features
==========================

* Improved interface

GEM Bench now uses dialog windows instead of modal dialog boxes. You may open several windows, move them around, close and top them. At any time you have access to the menu bar. If you open several windows at once, changing something in one is automatically reflected in the other. Changing the Blitter state in the main window for example is also reflected in the Save or System Info windows if these are open, even if they are partially hidden.
If you have several windows open, you can top any window by clicking on it or by selecting its menu entry or button that invoked it in the first place.

The menu bar can be used to perform a collection of tests. Three entries are available, Display runs all graphic tests, CPU performs the math and memory access tests and All Tests simply runs all tests. This items also have keyboard shortcuts which are available at ANY time.

The Hardware Reference box has an improved layout, making it easier to work out which system you are comparing your setup to.

* FPU support

The float math tests now use an FPU if one is installed. The file AUTOFPU.RUN must be in the same directory as GEMBENCH.PRG for this to work.

There is a special text file called FPU_CPU.TXT that discusses some of the difficulties in benchmarking the FPU.

* New test routines

Many of the routines have been improved. Notably, the CPU tests are now in assembler as opposed to BASIC (Thanks to Eric Northwood). The FPU test is written in Lattice C. The graphics tests have also been improved.

* System Information

The Info button opens a dialog displaying machine type, TOS version, AES and GEMDOS versions, NVDI, FPU and other information about the

system.

When using the Save or Print facilities, GEM Bench now adds info about TOS version, MultiTOS (MiNT) version, Blitter, NVDI, screen resolution and FPU.

* MultiTOS

GEM Bench is now MultiTOS compatible, utilising dialogs in windows which can be moved around the screen, topped and closed. The menu bar and therefore desk accessories and other applications are always available (except when test is in progress).

The best way to run GEM Bench under MultiTOS is to quit the Desktop (click on the Desktop menu entry while holding <Control>). Then using Load... to run GEM Bench. This reduces the overhead of having to redraw the desktop between tests. If you run GEM Bench from the desktop, the GEM Dialogue box and GEM Window tests will be very slow.

Process priority may be set by pressing the Priority button. This will bring up a dialog box where you can enter the required priority level. Positive values increase priority and negative numbers decrease it. The value range is -20 to +20. This sets ABSOLUTE priority level as opposed to delta (relative) values.

* Bug fixes and general improvements

The ST Review version (2.5) had a bug which caused the system to hang when trying to move the cursor in the Save and Print dialogues. This is now fixed.

When saving test results more than once, the chosen path is preserved, making the process a little easier.

The justified text test has a cleaner appearance when not using NVDI.

>calls and the multitasking do NOT access the file system. However, MiNT
>slows the machine down by about 1 or 2%, about the same as Warp9.
>
>
Hmmm there must be an awful lot of people deceiving themselves about Minixfs.
Seems like every new user of it who contacts me says how fast it is, probably
all liars. I probably got all the performance tests I made on Minixfs when
I was fine tuning it wrong too 'cos they showed it was quicker than TOS
filesystems too. No on second thoughts I'm probably a liar too.
You aren't by any chance using 0.55 are you which is well over a year
out of date ?
Right I've calmed down a bit now ...
I must agree though that MiNT is rather slow in some aspects. This is
primarily becuase it sits on top of TOS a lot of the time (you call MiNT then
MiNT calls TOS). What is really needed is to replace lots of the TOS calling
MiNT equivalents with low level versions.
Steve.

1827. DevPac 2

Newsgroup: comp.sys.atari.st
Date: 1993-07-24 21:37:59 UTC
From: slyster@outb.wimsey.bc.ca
Message-ID: <slyster.03iv@outb.wimsey.bc.ca>
Source record: 203360

I have a copy of DevPac ST 2, which came on the June 1993 issue of Atari ST User. Since I have NO IDEA how to program in assembly language, and since there is no manual included in it, I have a question.

Can one simply go to the library and use a 'How to program in Assembly language', or does one have to learn the DevPac ST language (ie. do I have to buy the manual!)

I have become quite bored with programming in ST Basic, as it is very slow, and thought it time to do programming right.

1829. Spectre - Hard Disk Formatting

Newsgroup: comp.sys.atari.st
Date: 1993-07-25 02:15:25 UTC
From: ak354@cleveland.Freenet.Edu
Message-ID: <22sqbt$f1d@usenet.INS.CWRU.Edu>
Source record: 203353

I am trying to format one of my hard disk partitions to support Spectre, but it doesn't seem to be working. The computer is a 2.5 Meg 520ST and the hard drive is a Quantum 240LPS using an ICD AdSCSI+ host adapter. I select the Format option from the Hard Disk menu on Specte 3.0. I have 9 partitions. The first is about 5 meg and the rest are a shade under 30 Meg. I select the 9th partition to be formatted. Spectre does it's thing, and lists this partition type as Spectre-P. (HFS) But when I quit back to the Spectre menu, the Partitions menu is still grayed out and neither Spectre nor the Mac seems to recognize this partition. If I re-run Spectre, it lists it as a GEM partition. It seems to work fine as a GEM partition from the desktop also. Can anyone explain why I can't format it for Spectre?

Actually, I would settle for TOS compatability, with a better file
system, also with GEMDOS compatability. Something like the VMS ODS2
file system would be good (this was also built with backward
compatability, but with the 9.3 filenameing syntax of RSX, so it
can be done...)

: checkers?

AW includes a Spellchecker and Thesaurus. It seems like it was modeled a bit after word. Which isn't say that it in any ways has the functionality of word. Generally, I think that AW is a good word processor compared to other available word processors on the ST.

: And SpeedoGdos, does it come with enough fonts, are they easy to get. And what
: printer drivers does it come with? I have an Epson LQ-570 24Pin 360x360
: printer, is it supported? It has ESC P2 commands, that are used for the

Speedo Gdos comes with 10 or so fonts. For $19.95 + Tax you can buy 50 more fonts from Egghead computer stores. You can also call 1-800-522-font in US and Canada, 61-2-550-3899 in Australia or New Zealand, or 31-20-575-3026 in Europe and order enough fonts to fill your hard disk.

There is support for an LQ-570 printer on the list of printers in the printer dialog. I don't know what resolution the print is in but there is a draft and a final mode quality option. I don't believe Speedo Gdos will support your internal fonts. All the speedo fonts are generated and printed graphically. This is one of the features or speedo that allows you to have any point size font you want.

I have 60+ fonts installed on my system. At bootup loading Speedo Gdos takes about 1 second. When loading AW, the font load takes about 4-7 seconds. If you turn width tables on, loading a gdos applications takes 30-60 seconds.

I have an Mega ST4 with Tos 1.4.

BTW there is a know incompatability between Warp 9 and Speedo Gdos printing. When you print the second page will bomb if warp 9 acceleration is enabled. If you are planing to print you can turn Warp 9 acceleration off. Or setup warp9.dat file to automatically turn acceleration off when running gdos applications.

Source record: 203363

ZIP and Lharc (LH5) are currently the fastest archivers for the ATARI line. Now, I ZIP files on a UNIX machine, using the new deflate algorythm, and then Unzip them to a MINIX partition and I get the full case sensitive file names with the full length! I can make STZIP create such an archive. Lharc now recognizes Unix style lharc headers and file attributes so it should be fully Unix compatible. And the new LHA_221 that I just installed is fast. Compared to the last Questor Lharc, which took about 20-25 seconds to de-archive Picswitch (my 97K test archive) the new LHA_221 took only about 5-7 seconds - it was hard to tell, the speed was so fast that the video was slowing things down since I'm without a screen accelerator right now, due to MiNt problems. Yep, almost 100K in about 6 or 7 seconds. I =LIKE= it. Now, what would be the prupose of using ZOO? Waste CPU time? ZOO archives are always the WORST for me when it comes to corrupted archives or extraction problems. ZOO is very user-hostile compared to LHarc, and VERY hostile compared to a nice GEM STZIP.

>
>->->->((JP))<-<-<-

Justify the price. What is it now? $99 while the special lasts!! For a 16MHz computer (softare switchable to 8mhz) with 32K of cache? Its a steal. As for compatibility, I know a few people that use one with no problems. The real test is my demanding set-up. E-Mail me in about a week, I ordered the STE version a few days ago :-) $129 is worth it - MiNT needs some more CPU cycles :-) So does GCC, and GEM could use some speed. With any luck NVDI will arrive on the same day, and I can install them both at once and blow my mind.

>bigger than an ordinary ST? It seems that the keyboard is just a little
>bit higher off my desk. Not that it matters to me, or will effect the
>operations, but just curious.

It's as high as an STF or STE, the old STs were a little bit lower.

>The manual says the within the General CPX, the Blitter option may or
>may not be preset. Well, there is no Blitter option here, just the
>speaker off/on. Why is this? There *is* a blitter here in this machine,
>yes? (more on this later). Again, not that it really matters, I would
>just always leave it enabled. The TOS is marked 4.04.

That's because the Falcon's TOS no longer contains any "no blitter" drawing
routines. Your TOS is the latest version.

>I did run an old indexing program I had, and it reported a blitter, but
>it also reported a 68000 (at 40MHz)...

Maybe your indexing program is too old. The _CPU cookie is correctly set to
identify the CPU as an 68030...

>Thats about it. All in all, I am pretty pleased, with some minor
>grumbles. Like why did Atari use the damned 9 pin RS-232C instead of the
>25 pin? Why are there no pin signals on the DSP pinout?

Q1: Because that's the usual pinout nowadays.
Q2: Developers have the pinout :-)

1839. CoNnect version 2...

Newsgroup: comp.sys.atari.st

Anyone know where I could FTP the demo of CoNnect 2 that is in english? I can find the german one all over the place and looking through the files I see it has support for English, but I think it's missing the appropiate RSC files.

I was told that CoNnect is one of the few terminal programs that work properly on the Falcon.

Thanks.

Why is it that even stockholders are oblivious to the day-to-day changes in the stock's price? Neither a) nor b) caused the most recent jump to 5 1/4. Likewise, no news accompanied the further drop to about 4 1/4. Then, on Friday, absolutely no news caused a jump 3/8 to 4 5/8 (if I remember the exact price). So please, watch the price every day so you know what you're talking about.

>price). So please, watch the price every day so you know what you're talking
>about.

No, he seems to know what he is talking about. I've watched the stock
prices jump all over the place and it seems to be related to news announcements.

The stock jumped up when the Jaguar announcement made several major
newspapers (Wall Street, New York Times).

The stock then jumped again when the Annual Shareholder meeting took place
and Atari announced IBM was making it. Remember that these shareholders
were even able to see the Jaguar.

The stock hit $5.50 at one point.

Then the stock settled because people were worried about that Japanese
chemical supplier for microchips burning down. This could raise the price
of the Jaguar chips and then raise the price of the Jaguar... so the
stock went back down to about $4.25.

NOW, the big news is the Associated Press article from Tokyo. The article
was entitled "Technology challenges video-game masters" and talks about
the 3DO and 64-bit Jaguar. The article goes on to say how Nintendo and Sega

are not keep developers happy and are stuck with their 16-bit technology.
The article ends with this quote:

"I would assume that software houses will be more than happy to write for it
(the Jaguar)," said Bendar. "I think the move to CD-ROM is going to kill
Sega and Nintendo."

The article was published Saturday July 24, 1993. Some people no doublt
got a hold of the article through the wires and that is what caused the
stock to jump up to almost $5 again.

If news does have an effect on stock prices, we may be seeing Atari's stock
trading over $5.50 again Monday morning... let's see.

1849. Music File Format/MOD & Tracker Programmer Mailing List Announcement

Newsgroup: comp.sys.atari.st
Date: 1993-07-25 20:17:47 UTC
From: jamal@bronze.lcs.mit.edu
Message-ID: <22uppb$7f2@bronze.lcs.mit.edu>
Source record: 203372
Cross-posted to: rec.games.programmer,comp.music,comp.os.msdos.programmer,comp.sys.apple2,comp.sys.next.programmer,comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.mac.programmer

Depending on the response I get, I will be starting a mailing list for the discussion of computer music application programming, with the MOD format as a major topic. The list will be for people from all of the major computers (Amiga, Mac, Atari ST, IBM AT, NeXT) because by now they all have mod players and soon will all have editors, increasing the amount of (hopefully) decent computer music available out there for everyone.

The problem is, there is alot of confusion about the "mod" format, and related mod-type formats (like MED, Okata, etc), and alot of the understanding of how to play these files comes from examining source code other people have written! What we need is a forum for people to talk specificaly about the music formats out there and exchange as much information as possible about them, in order to help everyone write better music editor and player programs!

If you are a programmer and want to write a mod editor (tracker) or mod player, even a general (MIDI or non-MIDI) music editor, or you have written one in the past, please send me email telling me you would be interested in being on this electronic mailing list... or if you know anyone else who has written a soundtrack program, or developed one of the music file formats, please forward this message to them!

I'm also looking for the original programmers of applications like "SoundTracker", "NoiseTracker", and the like.. some of these people are known only by BBS "handles", and may only have accounts on remote BBS systems. If you know any of their email addresses, please tell me.
(The people who originaly created the music file formats of course have the most information on them.)

>>> If you are interested in this mailing list, please send me email <<<

I am trying to install gnu C on my STacy4 so that I can compile
CC65 (the 6502 C cross-compiler). I downloaded the libraries, includes,
compiler, and make files. What do I have to do to make it work now?

Please email responses as I seldom read news.

Is there is a installation doc file - perhaps the FAQ?

just a bit more info -- I am trying to put it on my floptical (drive G)
all by itself since after I get this compiled I won't need it online
as I have Mark Williams, Sozobon and Alycon installed and working.

CoNnect in its version 2.10 is now available on atari.archive.umich.edu (should be move to /atari/Telecomm in the next days). The Filename is conn210i.lzh . This archive contains a complete english version of CoNnect (german helpfiles and resource are included).

- for Atari ST, STE, TT, Falcon
- fast, entirely GEM-conform window output
- text emulations: VT52, VT100, VT102/ANSI, VT220/7, VT220/8 complete and correct including all attributes, colours and nationalities, configurable character transformation
- graphics emulation: Texktronix 4014
- context sensitive, extensive English help system
- internal X-, Y-, Z-modem and soon Compuserve B, B+ protocol
- for ZyXEL modems: recognition of incoming call type and operation as anwering machine with arbitrary messages and call recording
- window dialogs for multitasking operation
- several parallel terminal sessions and / or command line interpreters in several individually configurable windows
- running under MultiTOS / Mag!x, supporting colour icons and `drag & drop' for automatic transfer
- powerful possibilities for operation by keyboard, hotkeys free configurable
- GDOS-output support, GDOS fonts even without GDOS
- support of baud rates higher than 19200 if hardware permits. (TT, MegaSTE and Falcon have rates up to 153600 baud)
- versatile buffer management, comfortable protocol recording
- scantables, e.g. for doorway mode
- powerful, many-sided script language for automated proceedings, including unix-like command line interpreter for interactive operation - connect is able to learn scripts by itself
- sound playing possibilities for SND, SMP and MOD files as reaction on system events
- telephone book, limited only by the available memory
- any external transfer protocols can be implemented
- comfortable modem reply handling

- powerful telephone expense calculation and statistics
- running on large screens and additional graphic adapters

Hope this helps ;-)

Wolfgang

Ive been using 2.0 (and the 2.02 update) of connect on my Faclon for about a week, and really love it, and guess what? It works BEAUTIFULLY under MTOS! I run MTOS in 16 colour mode, and its the best thing Ive seen in a long while.

Now for the but. But, since the author doesnt list a USA contact to register with, I will most likely just go back to Uniterm in a short while. Sending money to Germany is too costly...

That's just STARTLINGLY untrue. The MS-DOS (TOS) filesystem is renowned
as one of the SLOWEST there is. Half of the algorithms in it are
O(number of files in directory), not to mention space usage. Every
deleted a heap of files and wondered why it goes fast [ish], then slows
down at various points? Once you get a hundred or so files, the MS-DOS
filesystem gets annoyingly slow. Get a thousand and it almost grinds
to a halt.

The Unix (Minix) I-node system is MUCH more powerful, and much faster.

Why, then the Atari 520 ST would be:

1. A 40 bit machine (since it has 16 bit data + 24 bit address lines)
2. More than 524K RAM (524288 bytes, actually)
3. Multasking operating system (tm, nothing to do with multitasking)

] Anyone know where I could FTP the demo of CoNnect 2 that is in english?

There isn't an English version, to my knowledge 2.2 is the 'latest'
version, which is German only. (2.02 sorry!). Apparently 2.10 will
be further upgraded, and support English. It's the full package, not
a demo, the only limitation is that you can only use it for 30 days, and
if after that time you are still using it, you should pay Wolfgang
some DM!

(Version 2 now has internal protocols and color icons, they were the
2 major things I could spot)

: we even have better manners than OZZY's..:-)..
: PLus we were not a penal colony, not like OZZY...:-)..
: And we have a different Phone number...064..??

Well, I do know that New Zealand is a different country then Australia. I guess the American education system hasn't sunk that low... What I don't know is how to make heads or tails of those strange phone numbers the rest of the world uses. So anyway, the numbers and countries I listed were off the dial order line listed in the WP 6.0 font package. I just didn't know enough about phone number codes to recognize that anything was wrong.

So you can tell from the phone number what country the phone is in?? Or is it the case that the number is different when dialing in from out of the country compared to when the call is in the country.

Here's a laugh, a couple of years ago when I started using Netnews I was kinda shocked that .nz stood for New Zealand. I'll just say that I had a very backward idea of the state of development in New Zealand. ;-)

1861. ATARI FALCON030 & SOUND

Newsgroup: comp.sys.atari.st
Date: 1993-07-26 06:15:27 UTC
From: afonseca@terapin.com
Message-ID: <afonseca.4pz1@terapin.com>
Source record: 203385

Hi everyone. I'm a soon to be Falcon030 owner, and I have some questions about Falcon Sound. I don't know how many of you got the computer that shipped with the Audio Fun Machine? Or whatever the sound software was called.

I am wondering if this is a sound editor, or if there is one available. I'm looking to sample sound at CD quality and edit it on the HD, and then output it back. Is there a way to output it back digitally? How is the sound editor, features?

Also when playing back CD quality sound in stereo(best quality possible), does it slow down the machine? Can it still do other graphics intensive tasks?

And a few non-sound related question. Is there an accellerator avaiable for the Falcon030? 16mzh seems rather slow by todays standards. Much better than the ST's though. And does anyone know of any 24 bit color cards available? Any word on a 386 emulator? Any word on a color mac Emulator for the Falcon? What ever happened to the software modem. Any other info on Falcon products would be appreciated.

afonseca@terapin.com

I guess everyone is recommending using the Minix file system... considering
the biggest penalty my machine takes when doing serious work (compiling
with GNU C or G++) is when it goes to disk, can anyone tell me if it would
be worth it to move all my programming over to a Minix partition on my
hard disk?

(it'd be nice for the long filenames, but if it is that much faster, i'd
be ready to make the switch in a minix....er...minute... :))

Have a look in version 2.10. There you find exactly what you want.
Just print you registration form in the registrations dialog and
this one will already have the adress of Mike (near LA).

After a very quick test, I've found the following:/

Compressing a 250k sample, (not very compressable, takes quite a while),

LHarc v2.01i (Questers) - 2 minutes, 42 seconds

The new v2.20 - 1 minute, 50 seconds!

How's that for a big improvement, it now beats even ZIP-Deflate for speed!

Better results coming up after I've managed to get version 2.21!

I have moved my entire harddisc over to minix fs, even back when the docs still said that one ought to have either fsck or at lot of courage, and that was JUST to get better filenames (long AND case sensitive). Anybody who has ever transferred files from UNIX systems really gets a big bonus out of minix fs. This is of course less important if you aren't using many programs that can recognize the longer names.

I consider minix fs at the very least Highly Recommended (TM Jeff Pournelle, I think), if not an absolute must, for the even just slightly UNIX oriented atarian.

I have seen a number of postings asking for details about using the joysticks on the ST. This posting attempts to provide some help.

I never saw it properly documented, so about 4 years ago, using information from the old Abacus/DataBecker internals book, I set about investigating the Keyboard vector routines, using a packet handler which I could patch into the vectors I wanted to investigate. The C program I used is given below. As written, it hooks into the status and joystick vectors. For just the joystick information, it is not necessary to use the status vector. Obviously, the program could be cut dow to just bare bones for joystick handling, but I thought the complete thing might be of interest.

It was compiled using Lattice C 3.0.4. UBYTE is just a typedef of unsigned char. You won't need <portab.h> if you define this by hand. cprintf() is just printf() directly to the console. The include file <fctype.h> is just a variant of <ctype.h>, which itself would do fine.

It should be compiled to a .TOS executable.

```
------------------------------------------------------------------------
#include <portab.h>
#include <osbind.h>
#include <fctype.h>

typedef struct {
void (*midivec)();
void (*vkbderr)();
void (*vmiderr)();
void (*statvec)();
void (*mousevec)();
void (*clockvec)();
void (*joyvec)();
void (*midisys)();
void (*ikbdsys)();
```

```
} KBVEC;

UBYTE joy0,joy1;
UBYTE list[10];
int got=FALSE;

void dopkt(packet)
UBYTE packet[];
{
register int i;

for(i=0;i<10;i++)
list[i]=packet[i];
got=TRUE;

if (packet[0]>=0xFE) {
joy0=packet[1];
joy1=packet[2];
}
}

void main()
{
KBVEC *p,save;
UBYTE old0,old1;
char buf[128];
int cmd;
char c;

p = (KBVEC *)Kbdvbase();
save.joyvec = p->joyvec;
p->joyvec = dopkt;
save.statvec = p->statvec;
p->statvec = dopkt;

Ikbdws(0,"\x12"); /* Turn mouse off */

old0=old1=0xFF;
cmd = 0;

for(;;) {

if (Cconis()) {
c=toupper((short)Crawcin());
if (c=='\x03') {
Ikbdws(0,"\x08"); /* Restore mouse operation */
p->joyvec = save.joyvec;
p->statvec = save.statvec;
Pterm0();
}
else if (c=='\r') {
buf[0]=cmd;
Ikbdws(0,buf);
```

```
cmd = 0;
}
else if (c>='0' && c<='9') {
cmd = ((cmd & 0xF) << 4) | (c-'0');
cprintf("cmd = %X\r\n",cmd);
}
else if (c>='A' && c<='F') {
cmd = ((cmd & 0xF) << 4) | (c-'A'+10);
cprintf("cmd = %X\r\n",cmd);
}
}

if (got) {
cprintf("Packet = %02X %02X %02X %02X %02X %02X %02X %02X %02X %02X\r\n",
list[0],list[1],list[2],list[3],list[4],
list[5],list[6],list[7],list[8],list[9]);
got=FALSE;
}

if (old0 != joy0) {
old0 = joy0;
cprintf("Joy0 = %02X\r\n",old0);
}

if (old1 != joy1) {
old1 = joy1;
cprintf("Joy1 = %02X\r\n",old1);
}
}
}
```

Armed with the information gleaned by this program, it was possible to write assembler routines to setup, use and unsetup the joystick. JOYINI and JOYEND should be callable from ASM or C, and the global variables JOY0 and JOY1 will be updated automatically whenever a joystick state changes.

I can't remember what bit means what, but that is easily determined by trial and error.

```
;
JOYINI MOVEM.L A0-A1/D0,-(SP) ; Save registers
MOVE.W #34,-(SP) ; Kbdvbase()
TRAP #14 ; Xbios
LEA 2(SP),SP ; Better than ADDQ, as it
; doesn't set any flags.
; Now D0 points to the table of longword vectors. The
; joystick vector is at offset 24 from this.
;
MOVEA.L D0,A0 ; Must be in an addr reg
```

```
MOVE.L A0,ADRSAV ; Save table address
MOVE.L 24(A0),JOYSAV ; Save current joy value
LEA OURJOY(PC),A1 ; Position independent
MOVE.L A1,24(A0) ; Point vector to our code
PEA MOUSOF(PC) ; Command to turn off mouse
MOVE.W #MOUSOFL-1,-(SP) ; Length-1
MOVE.W #25,-(SP) ; Ikbdws()
TRAP #14 ; Xbios
LEA 8(SP),SP ; Tidy stack
MOVEM.L (SP)+,A0-A1/D0 ; Restore registers
RTS
;

1870. MultiTOS and AES 4: Performance

Newsgroup: comp.sys.atari.st
Date: 1993-07-26 10:29:20 UTC
From: djs@jet.uk
Message-ID: <1993Jul26.102920.22671@jet.uk>
Source record: 203398

I have big problems with MultiTOS in that the AES takes about 50% (or more) of CPU, presumably polling the mouse etc. An application program rarely gets more than 30% of the CPU. The `idle' task never seems to get any time at all.

Do I have something configured wrongly, or is the AES really that bad? Does one need to buy a TT in order to get ST performance with MultiTOS? :-(

Don't know about AFM, but there is D2D which lets you edit stereo sounds.
It also has an optional digital interface.

>
>Also when playing back CD quality sound in stereo(best quality possible), does
>it slow down the machine? Can it still do other graphics intensive tasks?

Not really, it's the disk access that slows the machine down rather than
the DSP and sound processing.

>afonseca@terapin.com

In the latest ST Applications there is a mention that sometime later this
year a 'new' model of the Falcon is (maybe, perhaps, you know what I mean)
coming out. The most interesting change
in the new model is a 32 bit path to the cpu. Also separate keyboard and
remodelled case. Of course knowing Atari's track record (as the article
pointed out) this may be complete b*sh*t. But if it's true, it might be worth
the wait.

1873. Upgrading help needed please.

Newsgroup: comp.sys.atari.st
Date: 1993-07-26 11:49:53 UTC
From: pd@mbuc.bio.cam.ac.uk
Message-ID: <1993Jul26.114953.16851@infodev.cam.ac.uk>
Source record: 203400

Hello again,

I am trying to upgrade my Mega 4 at the moment.
I have decided to get NVDI and Warp9 to get the best of both worlds.
I am also getting a big hard disk, calamus s (the new one without all the fancy
colour stuff I don't need) and a multisync monitor.

Now all I need is the money :-)

But first a question or two.

Can anyone send a list of multisync monitors which work on a st.
preferably including name, resolution, cost (important!), and anything else
useful.
Also, a list of requirements a monitor needs to have to be able to work.
ie frequency (50hz, 70 hz ...), cables, etc.
A place to buy a monitor in England would be nice as well.
So, which is YOUR favourite!

Is calamus a mono only program? (I think it is...)

I think a tos upgrade would be useful as I have got 1.2 at the moment!
Presumably 2.06 is the latest/best to have?

To connect a scsi hard disk, is all I need a ICD link to plug into the hard disk
port at the back? And are all scsi disks the same? (ie will _any_ scsi disk work)

Is it possible to have a hard disk inside the mega? what will I need for this
and is there any restrictions on type and size of disk to put in it.

Thanks for any help, it _is_ appreciated!

>newspapers (Wall Street, New York Times).

That is correct.

>
>The stock then jumped again when the Annual Shareholder meeting took place
>and Atari announced IBM was making it. Remember that these shareholders
>were even able to see the Jaguar.
>
>The stock hit $5.50 at one point.

This is also correct. And, yes, it topped $5.00 at one point during the day
and closed at about 4 1/2.

>
>Then the stock settled because people were worried about that Japanese
>chemical supplier for microchips burning down. This could raise the price
>of the Jaguar chips and then raise the price of the Jaguar... so the
>stock went back down to about $4.25.

Debatable. That happened a few weeks ago. The stock just dropped last
Thursday and Friday.

>
>NOW, the big news is the Associated Press article from Tokyo. The article

>Sega and Nintendo."
>
>The article was published Saturday July 24, 1993. Some people no doublt
>got a hold of the article through the wires and that is what caused the
>stock to jump up to almost $5 again.

This was not "big news". It was one dork who didn't know what he was talking about. Sega already has a CD, and Nintendo is building one as we speak. The Jaguar was only mentioned briefly. The 3DO was the system talked about.

People are not THAT dumb. If you look at my previous message, I said that there wasn't any news capable of doing what happened to the stock. I still maintain that.

>
>If news does have an effect on stock prices, we may be seeing Atari's stock
>trading over $5.50 again Monday morning... let's see.

Why? Nothing happened last week, yet a jump to 4 5/8. What news are you talking about now? The news that it jumped back up after the 2 big drops?

1875. MultiTOS Teradesk?

Newsgroup: comp.sys.atari.st
Date: 1993-07-26 12:59:02 UTC
From: bjb@praxis.co.uk
Message-ID: <1993Jul26.125902.14301@praxis.co.uk>
Source record: 203206

Is there a MultiTOS compatable version of Teradesk out yet? The
version I've got (1.3) works fine until you run a program but then hangs
until you quit back to it.
Anyone who is still using other desktops should have a look at
Teradesk, it has to be the best replacement out at the moment.

1881. The Blue Ridge AtariFest '93

Newsgroup: comp.sys.atari.st
Date: 1993-07-26 15:22:31 UTC
From: gt1448b@prism.gatech.EDU
Message-ID: <106304@hydra.gatech.EDU>
Source record: 203203

Just thought I'd share my experiences from the Blue Ridge AtariFest in Asheville, NC from this past weekend. Unfortunately, I was only there on Sunday. I was told that Saturday was a much more active day.

The Fest took place in the Westgate Shopping Center, home of Computer STudio. I first went to Computer STudio when I arrived. I brought along some Falcon demos I had DL'd off of atari.archive. They said they had already had most of them and that they couldn't show them because some were made for TVs and/or ST color monitors and others required more memory (sorry I can't be more specific). Their display Falcon was hooked up to a SVGA monitor. I was encouraged to sit down and use the Falcon to play with Atari Works and True Paint. Both programs looked good. The show prices were $95 for Works and $56 for True Paint. Works includes SpeedoGDOS and looked great. It was much faster than bitmapped GDOS (maybe not G+Plus though). One thing about SpeedoGDOS that I didn't know was that it will generate "standard size" bitmapped fonts from the Speedo fonts and use them like old GDOS with programs that aren't SpeedoGDOS aware. This was demoed on Easy Draw 3.0. This feature of SpeedoGDOS, IMHO, is great! Computer STudio had sold out of Works, but I ordered one at the show price. From what I could gather, Computer STudio had a supply of 12 Falcons 4/84 and had sold 8 of them when I arrived. I was given quite a sales pitch to buy one of the remaining 4. Show price was $1199. Computer STudio also had a deal with DMC: Calamus was $100, Calamus SL was $400. Special pricing was also available for EdHak v3.0, Hybrid Arts products, Dr. T's products, Steinberg-Jones products, and Oregon Research Associates products.

The companies that attended of which I can remember were: DMC, GEnie, ST Report, Codehead Technologies, MagiSoft, Missionware, Lexicor, and Hybrid Arts (sorry if I missed any). Gribnif had been there on Saturday. The turn out on Sunday was light, however this has traditionally been a one day show. I was told that there were 800-900 walk throughs on Saturday.

I was disappointed I missed Gribnif because I wanted to see a demo of Geneva. Fortunately, I discovered that Joe at the ST Report table was running Geneva on his Stacy 4/40. He demoed it for me and let me use it. I can honestly say it is quite impressive and compatable! On this Stacy at 8 MHz and Warp 9 loaded, I noticed no appreciable slow down. Currently the rudimentary shell that is built into Geneva simply launches applications via a special file selector (which allows multiple extenders to be defined for the various types of executable files).

Finally, I'd like to publicly acknowledge John Eidsvoog of Codehead.
I had brought my master disks of Warp 9 and G+Plus to be upgraded.
John told me that I didn't need to upgrade G+Plus unless I was running
on a TT or Falcon. He could have said nothing and taken my $10 for
the upgrade!

The one that has always worked for me is ps2form.tos. It claims to format disks that will work even on old braindead PS/2's (hence the name). It is available from atari.archive.umich.edu.

> Also is it on a E-Mail site......

I think atari.archive has BART for email service, but I have no experience with it.

First of all, in a later post someone mentions the problem with Gauntlet II activating the elf when the printer is not disconnected. In fact, you can leave your printer connected if you turn it on and set it to OFFLINE. The game will then function correctly.

As for the 4 player adaptor, they are easy to make. Here are some instructions:

---begin included text---

Article 21338 of comp.sys.atari.st:

Some games, such as Gauntlet II, allow four player
to play at once. Here are the pin assignments for
the cable. You need two female 9-pin plugs and
one 25-pin plug (don't remember if it's male or
female).

Joystick 3 Parallel Port
----
1 6
2 7
3 8
4 9
6 11

8 25

Joystick 4 Parallel Port
---
1 2
2 3
3 4
4 5
6 1
8 24

Parallel port pins 18-25 are all connected to ground.

I haven't tried building this myself, so I don't know if
it will work. Good luck!

> Spectre?

I just recently did this, with no problems. I first formatted it as a
GEM partition, then ran Spectre and formatted it, then rebooted. At that
point, the ICD desktop accessory reported the partion as being an OOP (which
is correct). I then ran Spectre (3.0) an everything was cool.

Try using the desktop acc to verify that the partition is both OOP and
active (little checkmark next to it). The latter may be your problem.

The minix file system sounds fun, not to mention useful, but the only docs I have on it say it's limited to GEM partitions and 512 byte sectors. Is this old news? Does it handle other partition types now? What docs should I be reading? (I'm reluctant to begin with the source unless that's the only way).

I don't care how fat it SHOULD be on other systems. On MY system, my GEMDOS partitions are MUCH faster than my MINIX partitions, no matter what version of the MINIX.XFS I use, GEMDOS is Faster, and it takes up less space. Minix is horrible. I noticed this and finally started doing benchmarks, and sure enough, MINIX was NOT faster at all, it was SLOW. Sure perhaps it IS faster on some other computer, but not on this one.

1893. FALCON SALES

After findin out more about this dork of a machine 'FALCON' was more of a sick Joke than a real computer....

This confirms my thoughts about it....

This was cut from STR 930....

- London, UK FALCON SALES OUTLOOK

Our super sleuth in the UK tells us that the Falcon sales are in the low thousands for all of Europe. The expected crushing rush for the new Falcon has yet to materialize. In fact, while the Falcon is satisfying the game machine affectionados in the UK and elsewhere, a number of support enterprises are on the verge of closure on the continent.

I do think its time that Atari close up shop....

No. Disk formats are similar enough on the ST and PC (read identical
except for a few bytes) that compiling it on the ST should be fairly
straightforward.

1896. Hard drive problem?

Newsgroup: comp.sys.atari.st
Date: 1993-07-26 22:53:04 UTC
From: jt@cortex.physiol.su.oz.au
Message-ID: <jt.743727184@cortex.physiol.su.oz.au>
Source record: 203236

Help! I own an atari 1040 STFM which has TOS 1.0 and I am running a Seagate 30 Meg SCSI drive using an ICD host adaptor. All was functioning in some sense of order until two nights ago when suddenly a message appeared on the top right of the Menu bar saying; M SENSE: off .

What does this mean? I am struggling to keep my cool in front of the customer (commercial recording studio) when suddenly as I tried to save the file (Notator 3.15) and proceeded through the usual routine of saving , the machine returned a message saying that the drive was full.

I know that there was plenty of space left on that partition as I regularly clear out my partitions and back up the disk.

After this the program froze, and I tried to reboot and got a message on boot of " No Host Adaptor present". I pulled the lid off of the drive case and listened to the disk and it had stopped spinning. I shut down the console and the drive immediately and waited a half hour and then rebooted the machine.

My reasoning was perhaps this was a heat re-lated failure. To my surprise the machine booted and I started checking through the partition to see what was damaged. I was continually prompted with the Data on drive C may be damaged" message and thinking that the worst had happened, I shut down and went home for the night. On returning the following evening, I again booted the machine and this time I was able to run software on that partition. I went through the partition and threw away all the files and folders that I thought I didn't need, and was careful to not write any files to that partition. (Or any other partition for that matter).

After about 3/4 of an hour the same message appeared on the top menu bar and within 2 minutes the drive wound down and that was it.

Help! I would like to get something like a Nortons Utility Disk for the Atari that actually works! I have several Public Domain Utilities all of which I have tried in vain and they all only allow me to address Floppy drives. I am so desperate to retrieve this customers file that I will buy any strongly recommended software Utility package. I am constantly diss-appointed with the Atari machine, It was shoddily built in the beginning, and the operating system is very much weighted towards the users of floppies.

I need some good advice as to how I can get around the many short comings of the machines file system. I would greatly appreciate any help or advice or experiential story that would give me some clue as to what has happened.

Sorry about the length of this post,

JT

>Peter Sinclair-Day University of Northern Iowa Cedar Falls, Iowa

This is not an answer to why Atari cant provide better expandibility,
as indeed they should. I feel they should also all have the detacheable
keyboards, as that allows you to stick the computer in a corner or on
the floor.

I just want to point out that no desktop mac comes with a keyboard, as
your message seems to imply. I guess Apple considers the keyboard to be
optional. (Actually that allows the user to buy the specific keyboard
that they like best. But it is also a way for Apple to make their
prices look even cheaper than they are. The keyboard is $100 to $250
depending on which you want!)

1899. Braindamage - a new demo from Aggression

Newsgroup: comp.sys.atari.st
Date: 1993-07-26 23:33:40 UTC
From: kkallio@vipunen.hut.fi
Message-ID: <kkallio.743729620@vipunen.hut.fi>
Source record: 203226

Aggression has released a new demo called "Braindamage" yesterday. I have just uploaded it to ftp.uni-kl.de and atari.archive.umich.edu. Names of required files are BDAMAGE1.MSA, BDAMAGE2.MSA and BDAMAGE.README. This two-disk demo works on 1/2/4 Mb STe and should also work on Mega STe.

Naturally it requires a color monitor (and a hifi equipment) to work.

The demo contains many effects not seen in any ST(e)-demo before, and some of them are unique in the scale of the whole demoscene, including Amiga and PC.

Anyway, we didn't make this demo to prove that STe is as capable as Amiga (it's not), but from now on when your friend claims that it's not possible to do fast vectors on STe, you can show him this demo.

This is still not a vectordemo - far from it. It contains almost 30 effects, anything (except scrolltexts) from a dot landscape to 50 fps filled vector city.

This demo is a result of hard work of 7 months, and it can be seen in the quality. Download it and take a look.

You can send your comment to:

Version 2.21 just arrived at atari.archive 2 days ago, it's now available in Archivers/lha221.zip (and also linked in Newitems...).

Does anyone know of any reason to keep the older versions around (2.20, any older ones, etc.?) 2.21 seemed to work fine for me.

Well, I don't take Atari's blatant optimism without a grain of salt, and i
guess I have to be fair and say that given Mariano's past history with
Atari, and his excellent (gag!) reporting, I won't take this one seriously
until he (or someone else):

1) gives this "super sleuth"'s name
2) can back up the statements

This is tabloid journalism.

(I remember back when I had to hunt down Ron Kovacs who did ZNET for the ST
to tell him he had omitted me from a listing of vendors at the Pittsburgh
Atari show back in '91... i had two tables.. more than any non-dealer vendor!
He told me... "Well, i guess you just weren't important!" and never mentioned
ENiGMA Software... i love the attitude of these online journalists... and they
wonder why some of us don't write commercial stuff?)

1902. Announcing... NetHack-- 3.1.3!

Newsgroup: comp.sys.atari.st
Date: 1993-07-27 02:20:38 UTC
From: cherborth@semprini.tdkcs.waterloo.on.ca
Message-ID: <H.ea.pmGoPkpzDds@semprini.tdkcs.waterloo.on.ca>
Source record: 203239
Cross-posted to: rec.games.hack,comp.sys.atari.st

Announcing...

NetHack-- 3.1.3!

The DevTeam snuck a new version of NetHack 3.1 out last week, just as I was trying to finish the NetHack-- 3.1.2 patch... Well, luckily, the 3.1.2 to 3.1.3 patch didn't change anything that affected my changes to the code...

I'll be posting a patch to the NetHack 3.1.3 code to convert it into NetHack-- 3.1.3; NetHack-- 3.1.3 adds about a dozen new artifacts, more than half a dozen new special rooms, about 140 new monsters and a few other nifty things.

However, if you have an Atari ST/TT030 or Falcon030, you can play NetHack-- 3.1.3 _now_! FTP on over to atari.archive.umich.edu or any of its mirrors; it should soon be appearing in the Games directory... the filename is nhmm31c.zip, and requires a fairly recent unzip (5.0 will do) or ST-Zip 2.x. Please don't bug me or the archivists; they'll get around to it as soon as they can, and I don't have the time or resources to be sending people copies of the program archive.

Those of you with other computers will either have to compile it yourselves, or beg someone else to do it. If I get a chance, I might be able to build it for DOS and OS/2, but you really shouldn't count on that... I'm very busy (NetHacking and massaging some other source code... oh, and working... ;-)).

If you build NetHack-- 3.1.3 for any platforms, please let me know, and upload it to an FTP site near you. If someone wants to make the NetHack-- code available for FTP, let me know.

It will come to that... Apple's new DSP macs will be out on Monday August 2 at
MacWorld Boston. The prices are lower than expected.

The Centris 660 AV with a dual dsp for sound and video, built in GEO ports, the
casper voice recognition will cost $2139(8/80 config) list. This model will be
powered up with a 25 mhz. 680400. Atari does not have a chance. I suspect
Apple will ship out in the week of its releace(next week) volume that will
surpass the install base of Falcons. Nice try Atari. But you deserve to go
out of business.

Ok, so it looks like the guys at umich released conn210i.lzh into the public area, so I snagged it today. Great, now I dont need to learn German :-)

(no offense, but between learning japanese on the side, and other stuff, I dont really have the time)

Anyways, it doesnt seem to send anything to the modem. I get to the window, and start typing the AT commands (Im old fashioned, I can type ATDTxxx faster than pulling up the dialer...), but nothing happens. THinking that maybe I do need to use the dialer, I used that, but still nothing...

So I pulled connect.prg out of the conn202u.lzh file, thinking that maybe something was wrong, but that still didnt work.

I love the program, and will register, but want to use it first before I do (never buy a car without a test drive...). Does the above mean that I need to register first before its fully functional? Does anyone else have these problems?

(btw: the machine is a falcon with TOS 4.04 and a USR sportster 14.4k modem)

Thanx

Im not sure I follow this: do have to play with things to switch
video modes? Why? I got an Axiom multisync monitor, picked it
up when I purcashed the Falcon (from the same dealer, just to be
sure that the monitor works well, etc...). He gave me a doo-hickey
that adapts the plug to the Falcons port, and off I go. I can get
all the modes without doing anything but choosing it thru the
desktop...

Since my MegaFile 30 was already formatted when I got it, I've never had to deal with Atari formatters (experience with MS-DOS 5.0 probably does not count). I have acquired a Supra 30 with a dead drive, and have now also acquired a Quantum 105 to go in it (as soon as I find a two-position .100 receptacle for the LED cable).

I'd like to hear the netwisdom as to the best software to use in formatting and maintaining this beast. I am interested in your experiences with whatever's out there, be it commercial or shareware.

AdvTHANKSance.

Nice offer, but if people can't use BART and they don't have ftp there's
always ftpmail. Btw, the directories at a.a.u.e would they be for ex.
/info? It's not /Info i've tried that. Anyone know? In terms of ftpmail
is it 'chdir info' or 'chdir /info' or even 'chdir /atari/info'?

>>any time at all.

>It may help to decrease the priority of GEM using the Mint utilities.
>I don't know whether there's a way to do this automatically.

the AES (as far as I know, correct me Eric :)) sucks up unused RAM, and
unused CPU time, it then dishes stuff out as needed.
Idle programs of course get 0-2% CPU time. since they AREN'T DOING ANYTHING!
Kinda a clash of ideas (since the AES is 'idle' kinda) but the AES is a
special case.

if all of a sudden, that Idle Spreadsheet was put into 'recalc' mode,
then the CPU time on it would jump up to 20-30%, and the AES time would drop.
(or other lower priority tasks)

if you want the spreadsheet done ASAP, renice it to a higer value, and then
it can get really high percentages of CPU time.

Theoretically, it could block out almost everything else. (this was
discussed in the .st.tech group concerning MTOS games)

>>Do I have something configured wrongly, or is the AES really that bad? Does

>this old news? Does it handle other partition types now? What docs should
>I be reading? (I'm reluctant to begin with the source unless that's the only
>way).
> Steve

The previous version (0.55 I think) does work with larger sectors. I have it installed on my 20 Mb (1 partition) atari disk, and it runs just fine.

The new version (0.60.5) should be even better in dealing with strange setups, if I understand the docs correctly. It also has a fsck (filesystem checker) which is a very good thing to have.

The docs keep saying that this is an alpha release, so the safe bet would be to get the 0.55 version, which I have experienced to be stable and robust. Guessing from my experiences with that version, I *think* that getting the newest version would be OK. I will certainly install it on my HD, as soon as I get it compiled.

But as always, there is no alternative to regular backups!

1914. Lharc info....

Newsgroup: comp.sys.atari.st
Date: 1993-07-27 07:43:25 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <232matINNscv@golem.wcc.govt.nz>
Source record: 203216

Slightly better LZH (Lh5) tests.....

Comparing to ST-ZIP 2.2

ST-ZIP (Best compression mode) 2m 9s file size 244564
ST-ZIP (Fast " ") 2m 4s " " 244588
LZH 2.20 1m 52s file size 243294

Tests from packing assorted files totalling approx' 300k.

These were from packing a single 12.5Khz Sample file, approx' 350k....

ST-ZIP (Best comp' mode) 1m 47s file-size 325049
LZH 2m 14s file-size 325700

Due to ST-ZIP's headers, when compressing many files, it loses for size,
but with a single file it beats LHarc marginally (not enough for anyone
to care about). Exactly why it was quicker than LZH (by a fair bit)
when compressing this one file, I'm not sure! (ST-ZIP seems to read
in larger chunks of the file at once, and as the file was read from
floppy, this may account for some speed loss, but as this particular
drive had a cache on it, access time is pretty quick!)

I've just notices an ST-ZIP v2.3 released, so now I've got to test that
as well - Argh! An inquisitive person's job is never done! 8-)
(Probably speed optimisation to compete with LHarc 2.2! ;-)

UK Only I guess.

FOR SALE: The following stuff, mainly for the Atari ST. Everything except
the drive is boxed. It all works fine.

These I can post:
1 meg external floppy. 40 quid
Stereo Replay sound sampler. (Virtually Unused). 45 quid
Vidi-ST video digitiser. 40 quid

For the following you probably need to be in the Yorkshire area. (or
be willing to pay carriage):
SC1435 Colour Monitor (Virtually Unused). 160 quid
SM124 Hi-res mono monitor. 60 quid
Citizen 120-D 9-pin printer (inc paper & ribbons). 70 quid

Offers welcome on any or all of this (I`ll take a bit less for it all than
if I split it).

Well, there is still a problem using MiNT:

When packing to an archive Lharc creates a temorary file in
$TMPDIR. It does *not* move this file to the current directory
and rename it to whatever.lzh.
I tried it on ramfs and minixfs.

I believe the older Versions used . as a tempdir, that's why
this didn't occured before.

BTW, this is *not* a reason to keep lharc <2.20, rather a
reason to move to lharc 2.21a

>
>
Yesterday I made a hard benchmark for the filesystem: I unpacked mntlib32.zoo
on a tos partition and on a minix partition.
On the TOS partition (normal TOS 3.6 without mint) it took about 2:56 min for
the 250 files. Under Mint on the minix partition, it took about 1:00 min
(in words one minute!) to unpack it, plus at most 5 seconds for the sync demon
to get woken up and syncing. (ok, so much to what you called bullshit)
In fact the minix fs can be a bit slower when doing fsfirst/fsnext, because
mint will do two operations on the fs (internal concept), as opposed to
only one call on the tos partition. But when you do Dreaddir/Fxattr, then
the minix fs will be a lot faster.

The test was done with minixfs 0.60 pl5.

So fine and dandy for Apple. According to a recent article in the
business section of our local paper, Apple is not doing that much
better than Atari. Look at the number of computers they have for
sale. Think about the development costs to design those machines.
Think about how they have to price them at very low profit margins to
compete against PC clones. Sure Apple may be the biggest single
manufacturer of PCs. But according to this article, Apples hopes are
all based on their ability to put out a PowerPC based machine within a
year. It looks bad for ALL Motorola based PC manufacturers these
days.

I called a stock quote line to see what Atari's stock was trading at and
it said $24 something...

It said it went up $19.

I called a half an hour later and it was back to its normal $4.75.

But that was certainly a shocker. :)

I've just got myself a Canon BJ10sx (the ex's replacement) and am hoping to tap some of the net wisdom on using the wee beastie with ST's. In particular -

- Options for GDOS drivers
- Good picture dumping utilities
- any software that people have found impossible to use with it ?
- so far I've been using the Epson LQ mode - is there any real advantage to 10ex mode ?
- How many times is it practical to re-fill an ink cartridge ?
- any other good tips ?

Thanks for any help,

Sam

1927. Please help with assembler code (Steve Eker?).

Newsgroup: comp.sys.atari.st
Date: 1993-07-27 18:23:40 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <88631@ut-emx.uucp>
Source record: 203257
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi,

Steve Eker sent me an assembler image transformation routine to use in Ghostscript. It works fine (with minor modification) for 2 and 4 bit color, but it clearly cannot work for 8 or more colors. I cannot reach Mr. Eker via email, so I am asking the net for suggestions on how to modify the code to handle more color planes (I am not much of an assembly programmer). The (4-bit) code is included below.

This routine is used to convert an image from Ghostscript's format to the standard GEM color-plane format. The Ghostscript format has all of the bits representing a pixel stored together in memory. For 4-bit color, this means that the first byte of the image contains the first 2 pixels.

The problem with the routine below is that it uses address registers to store pointers to each color plane. Eight color planes would require 8 address registers, which is pushing the limit, and 16-plane color is out of the question. Can anyone suggest modifications that will work for >= 8 color planes?

Thanks,

Tim Gallivan

```

I am going back to start some software development for the ST after a five year hiatus. I must be very out of touch with the software available now, so maybe some of you can help me get up to speed:

(1) Is there an ST FAQ list somewhere, and if so, where?
(2) What is the group consensus on the best C compiler for the ST?
(3) What is a good PD ramdisk, and where can I grab it?
(4) What is the best version of TOS that I can run on a 1MB 1040STf, and where can I get it?

> Steve

I think the 512bytes sector limit went with 0.4x (i.e. so long ago I can't
remember, and I wrote the damn thing). After that its 1K or 512 bytes. The
newer versions work with arbitrary logical sector sizes.
Different partition id's is a bit of a sore point :-(With XHDI compatible
hard disk software yes you can use RAW and MIX (that is XHDI 1.10 or more).
Without XHDI the best you can do is to manually tell Minixfs where the
partition is on the disk, well I say the best you can do ... you can't yet
because the binary config program isn't finished yet.
Steve.

Ah well no rest for the wicked :-) fsck wont defrag a partition but a port
of the Linux defragger I've done seems to work OK, it's still under test
though and has only been sent to the MiNT mailing list.
Steve.
P.S. please don't everyone swamp me with requests for the defragger ...
I'll get it going as soon as I can.

** WANTED ** 1040ST / mono / floppy / good midi software

A color monitor or hard drive would be fine, but I don't
think that I really need either of them. I really just want
an inexpensive setup that would make a nice amatuer midi
sequencer and terminal. I'm hoping that you may be a musician
who has gotten much use out of this interesting computer and
have decided to upgrade.

>
On the menu item where you select video modes, if I select the compatibility
mode for ST mono (with monochrome detect inactive), I get a high resolution
interlaced mode. If I switch the monochrome detect signal to active, the
machine does not automatically re-boot (unlike my old Mega), but if I re-boot
manually the machine comes up in a very good match to ST monochrome mode. All
video mode selection boxes are grayed out. Somehow, I just presumed this
behavior was normal. It's possible that this behavior is an artifact caused
by the doo-hickey that adapts the falcon's port to the round plug on my
monitor switch box.

: I just want to point out that no desktop mac comes with a keyboard, as
: your message seems to imply. I guess Apple considers the keyboard to be
: optional. (Actually that allows the user to buy the specific keyboard
: that they like best. But it is also a way for Apple to make their
: prices look even cheaper than they are. The keyboard is $100 to $250
: depending on which you want!)

The keyboard does come with the Mac LC machines. For the Centris and Quadras,
you have a choice of the standard keyboard, the aircraft carrier sized
keyboard, and the three piece split-in-the-middle keyboard.

I agree that Atari should have a detachable keyboard, instead of a keyboard &
CPU with a dozen cables hanging off the back.

John Hoffman (jhoffman@netcom.com) wrote:

: Problem with Apples new computers is that it's a dead end system. Apple will
: will be phasing the Mac out as soon as the powerPC hits sometime next year.

: Now with the Atari the falcon will be the computer that Atari is still shi...
: 5 years from now. Think of the savings in money and software. Fact of the
: matter is I'm still using the same ST computer I bought 5-6 years ago. It
: also still does what I need.

You could say that about MS-DOS systems, too. It would be great to be able to use all my old software. But it's a lot of work to keep full backwards compatability while making improvements to the machine. For me, the improvements in hardware and in the OS justify breaking some old software. I would be really disappointed if people still had to work with eight character filenames and three letter extensions.

Power PC isn't going to obsolete the Mac anytime soon. Making a new platform doesn't mean that old software isn't going to run anymore. It's not like the 8-bit to ST transition. Apple's Power PCs will run Macintosh software, without recompliling or modifications. Macintosh is still a real live platform, and Apple will still make Macs five years from now. (And they're all going to be using at least a 68040 processor -- none of that old 68000 stuff).

I just wanted to clear up some misconceptions here. Some people seem to think that Atari's technologies are many years ahead of everybody else's, and that the new machine will make everybody want to go out and buy one. The 1040 ST was great when it was introduced, but other companies soon surpassed it.

What I hope is that Atari will keep improving their Falcon (040 maybe?), so that in five years, Atari might be making that same Falcon030, but they'll also be selling better models (with voice control and video processing, etc.).

> ^^^^^^^^^^^^^^^^^^^^^^^^^^^^

This is utter non-sense! Since when does a company deserve to go out
of business because they didn't release the biggest, most powerful,
cheapest computer in the world? Apple just happens to have a lot
more resources to put it's multitude of (very similar) machines.
Atari, on the other hand, is doing quite good with what the've got.
If we didn't have such a robot mentality when it comes to computers
(ie everyone having to have what everyone else has or what happens
to sell the most), maybe the small guys like Atari and Commodore would
have a better chance of it. I don't really care if my computer is
the one used at work or the one used by everyone else I know or even
if there is tons of software for those other computers. I happen to
prefer the Atari alternative and as long as there is the bare minimum
of quality software available (do I really need dozens of word proc-
cessors to chose from?) then I have what I need and most importantly
what I want. Stop wishing doom on Atari just because they do not
meet your particular expectations.

Source record: 203277

Today I opened one of the AtariWorks packages that came into the store
to verify for a customer that it was indeed shipped on 720K disks and
that the install program worked on non-Falcon machines. (He's had
a bucket of problems trying to get the system installed on his
Mega 2 TOS 1.02 machine...) Since Atari originally shipped Works on
1.44Meg disks, and then the snafu with the dictionary, he was
rightfully concerned. Since the replacement disks came with SpeedoGDOS
as well, we looked at those disks too.

Surprise. George Woodside's VirusKiller monitor guard binged when we
looked at Speedo disk #3. Sure 'nuff, on closer investigation V-Kill
reported a known virus ('Key' or Signum virus....)

This prompted me to open every package we had gotten in, and the same
virus was reported on all four of them.

This is a warning to all persons who buy the 720K-disk version of Works.
CHECK THE DISKS WITH A REPUTABLE VIRUS KILLER BEFORE YOU CONTAMINATE
YOUR SYSTEM!

>: that is)????????
>
>Do you REALLY need any other archivers apart from tar and cpio? I bet you
>don't.

Well.. yes I do actually. I run a dual floppy only system, and need to
be able to extract/uncompress single files from within an archive
without having to find disk space for the whole thing in uncompressed
format, which is necessary when using a compressed tar or cpio archive.
I also often browse and read text files from inside STZIP. This means I
can keep the files on disk in a compressed format. (This may seem
difficult but it is no hrader to fire up STZIP than it is a dedicated
file viewer/browser on a floppy only system.

BTW I use all of the various archivers for different purposes so don't
construe the above comments as a part of any Archiver flame war. :-) :-)

Cheers,

LZH and ZIP are both close in compression sizes. There probably isn't a clear winner amongst the two. Lharc is on the way out though as it seems most people have or going to switch to zip since it seems to be the way ta go. It looks to be the standard for pc users and that says something.

1952. gnuplot 3.4 binaries available

Newsgroup: comp.sys.atari.st
Date: 1993-07-28 07:35:24 UTC
From: Alexander Lehmann <alexlehm@rbg.informatik.th-darmstadt.de>
Message-ID: <235a7sINNliq@rs18.hrz.th-darmstadt.de>
Source record: 203286

Hello all,

since there were some mails requesting it, I have decided to put out a binaryrelease of gnuplot 3.4 for the Atari.
The current version has some bugs, a bug-fix release is in the works, so feel free to complain about the bugs you find.

The archive is available at ftp.informatik.rwth-aachen.de currently as /tmp/gnuplot3_4.zoo, but will hopefully be moved to /pub/atari/gnu soon.
(length 356839 bytes, don't forget binary more)

The archive contains the Atari executable, demo files and interactive and TeX documentation.

bye, Alexander

P.S. I'll be on holiday in the states until August 20th, so don't expect any replies until then.

>Future versions of MultiTOS will be better regarding this (and why would you
>want that an `idle' task gets CPU time?).
I think you misunderstood me here; the `idle' task is one that is running at lowest priority, and soaks up `spare' CPU time. It therefore gives a measure of how much free processing power you've got. Even when sitting at the desktop, doing nothing, this task gets 0% because, it would seem, the AES polls the mouse and keyboard, when it should be interrupt/event driven.

And when are these better versions of MultiTOS due? And will I get a free upgrade to fix this design flaw?

>Hello again,

>I am trying to upgrade my Mega 4 at the moment.
>I have decided to get NVDI and Warp9 to get the best of both worlds.

They will not work at the same time, you know... If you get NVDI, there's really no reason to get Warp9 (except for the background picture o the desktop, the mouse accelerator, and the screen savers, but you can get those elsewhere...)

>I am also getting a big hard disk, calamus s (the new one without all the fancy
>colour stuff I don't need) and a multisync monitor.

>Now all I need is the money :-)

>But first a question or two.

>Can anyone send a list of multisync monitors which work on a st.
>preferably including name, resolution, cost (important!), and anything else
>useful.

In my opinion, it's not worth geting a multisync for just ST graphics. Sure you can get color and mono on the same monitor, but it is both cheaper and better quality to buy a SC1224 and an SM124 with a monitor master. Obviously, you already have one of those, and I've seen SC1224's for under $100 and SM124's for about $80.

However, if you plan on getting a graphics card (which I highly recomend), you'll need a multisync. I just got my Nova VME 16m for my TT, and they make a version for the Mega. Call Lexicor at 510-848-7621. The 24 bit card I got cost $529, and the Mega version is cheaper. It does 1280x1024 16 colors if you have the right monitor, a 90MHz graphics bus, a new VDI (so you don't have to buy NVDI), hardware scrolling with virtual resolutions, and much more. I'm very impressed!!!

>Also, a list of requirements a monitor needs to have to be able to work.
>ie frequency (50hz, 70 hz ...), cables, etc.
>A place to buy a monitor in England would be nice as well.
>So, which is YOUR favourite!

Philips is just coming out with a new 17" monitor that I'll be getting for use with my graphics card. I don't know where it's available yet (I don't quite have the $$$ yet), but it's MSRP is $1400 or so (which means it's Computer Shopper price will probably be around $800), which is quite good for a 17" monitor, especially with all the features it has...

>Is calamus a mono only program? (I think it is...)

>I think a tos upgrade would be useful as I have got 1.2 at the moment!
>Presumably 2.06 is the latest/best to have?

Definitely. Talk to CodeHead Technologies about the TEC card.

>To connect a scsi hard disk, is all I need a ICD link to plug into the hard disk
>port at the back? And are all scsi disks the same? (ie will _any_ scsi disk work)

All SCSI disks are a little different, but I've never found one that
didn't work with the Link.

>Is it possible to have a hard disk inside the mega? what will I need for this
>and is there any restrictions on type and size of disk to put in it.

ICD makes (or at least used to make) an ICD Micro host adapter for an
internal drive in the Mega. They're haveing a housecleaning sale right
now, and Micro host adapters are very cheap. So give them a call...

>Thanks for any help, it _is_ appreciated!

Well, I hope so.... :)

1957. Before Dawn / NetFS search

Newsgroup: comp.sys.atari.st
Date: 1993-07-28 15:57:40 UTC
From: bjb@praxis.co.uk
Message-ID: <1993Jul28.155740.3082@praxis.co.uk>
Source record: 203297

I recently read somewhere about a screensaver called Before Dawn that
was similar to After Dark on Macs and PCs. Does anyone know anything
about this program, like where to get it and whether it's shareware,
PD or comercial.
Secondly, are there any network programs around (PD/Shareware) that are MTOS
compatible? (Preferably XFSs with source code) I've used MX2 net but
it doesn't seem to like MiNT and can only be used between two
computers.

Thanks in advance.

1958. GEM message queue

Newsgroup: comp.sys.atari.st
Date: 1993-07-28 16:05:50 UTC
From: jansteen@cwi.nl
Message-ID: <10800@charon.cwi.nl>
Source record: 203293

The other day I was sending myself redraw messages:

```
msg[0] = WM_REDRAW;
msg[1] = app_id; /* AES's application id */
msg[2] = 0; /* 16 byte message */
msg[3] = w->win_id; /* GEM's window id */
msg[4] = rect[0]; /* Redraw area */
msg[5] = rect[1]; /* ... */
msg[6] = rect[2]; /* ... */
msg[7] = rect[3]; /* ... */
```

and noticed that (probably) AES frooze. I guess it was because of a
message queue overflow. I was scrolling through a text window keeping
the mouse pressed... this caused a lot of redraw messages.

So, is there a way to check the message queue, avoiding it to overflow?

Have you heard the term being competitive. Hello, Hello: The Centris 660 AV
with two dsp's will cost $2139 list and will be powered by an 040. When users
see the this new Mac, they will not want a Falcon unless Atari drastically
reduces its price...

The market will decide what form Atari is..

Apple just happens to have a lot
> more resources to put it's multitude of (very similar) machines.

> cessors to chose from?) then I have what I need and most importantly
> what I want. Stop wishing doom on Atari just because they do not
> meet your particular expectations.

Your right Atari does not meet my expectations. I for one thing like the
diversity of the Mac Software base, something that the Atari platform lacks.
But the reality is when the those new Macs hit the street this monday, there
won't be a market for the Falcon except for die hard Atari users....

That won't be enought to sustain Atari unless they drastically cut the price and get that 040 Falcon out that has to be half the price of the new Macs..

> --
> Opinions expressed are my own.
Its a good thing, your wrong. These are the same pundits who wrote off the
company when they restructured in the previos years. Apple not doing much
better than Atari is a laugh. Atari only sold 50,000 units in 1992 and Mac
sales were about three million units. Yes Apple development costs are higher
than Atari, but Apple has consistent product to sell. When Apple announces new
products you don't have to wait months and years for it like on the Atari
platform. Doesn't Atari priced their products at low profit margins. I
remember When Atari users deried Apple's high prices and they brush off
lowercost macs as saying Apple is not making money and it won't become a threat
to the Atari line.

Just wait until Monday And Atari will have to do two things or maybe three.

1963. PostScript for Cubase on Atari: done it!

Newsgroup: comp.sys.atari.st
Date: 1993-07-28 16:29:55 UTC
From: thumpy@dcs.qmw.ac.uk
Message-ID: <CAvv5w.449@dcs.qmw.ac.uk>
Source record: 203295

Hello all.

Do YOU want to generate PostScript of your scores from Cubase on your ST?

Well, we did, so we wrote a little program to do it (sort of). Basically,
what you need to do is this:

1. Get a print spooler that allows you to save printer output in a file.
E. Micklin's Magic Spooler seems to work (m_spool.zoo at
atari.archive.umich.edu, Printing directory).

2. Install HPJET.PRN as your printer on Cubase.

3. "Print" your scores to files.

4. Get our program, HPJ2PS.TTP and run it on the files. You can ftp it
from ftp.mcc.ac.uk (pub/cubase) or redstar.dcs.qmw.ac.uk
(archive/midi/cubase).

..et voila, PostScript. OK, so it's stuck at 300dpi resolution and is
pretty slow, but it works. The next step is to write our own spooler with
PS capability built-in. If anybody's written a spooler before, we'd appreciate
some help!

I compiled it on a Falcon using GCC 2.4.4 and tried out a few pages on
GhostScript on a Sun and printed them on an Ethernetted LaserWriter IIg.
At the moment it's really not been tested much, so if you try it, let us
know what happens.

Share & Enjoy,

It's seems to have been the standard on the PC way before the latest version came out...

It all depends on the platform you're looking at; the faves for some platforms seem to be:

Atari ST: LHArc
MSDOS : PKZIP
UNIX : ZOO

And to note, the latest versions of each of the above compilers are available on *ALL* of the above platforms, and their resulting archives can be handled regardless of which platform you're on. The other thing to note is that the LH5 LHArc method, the "zoo -h" method" and the PKZIP 2.04 DeflatX method produced very similar-sized archives.

When LHArc took the spotlight away from the ST years ago (due to its substantially smaller archives), I (and I'm sure many people) converted all my ARC files to LZH files. I have not, however, converted from LZH to ZIP for the simple reason that it doesn't seem worth the time to convert since the resulting archives will not be that substantially smaller.

And for the Amiga-fans, I'm not very familiar with what's available on that platform, so I'm not ignoring yunz (although I think I have seen LHArc-compatible files in amiga file areas, so...)

Robert Anisko
ranisko@ipc41t.daytonoh.ncr.com
R.ANISKO@genie.geis.com

I have a utility called (I believe) File_Finder that will do just this. You type in a string and a search path and it will search all files for that string. If you can't find it on atari.archive.umich.edu let me know and I can mail it to you in UUencoded form.

>(btw: the machine is a falcon with TOS 4.04 and a USR sportster 14.4k
>modem)

Have you ever used it successfully before, in any version? Sounds like you
haven't. (Always a good thing to establish.) Are you running MultiTOS or MiNT?

There are a couple difficulties in using the Falcon's serial ports; the bug
is present in all existing Falcon ROMs (TOS 4.00 to 4.04). It is also trivially
simple to fix, although by rights the bug should never have existed in the
first place.

If you are running with MiNT, and you have not run an appropriate patch, you'll
see the exact behavior you described - the bug causes the serial port to be
disabled after MiNT has initialized itself. If you run without MiNT, Connect
will run fine.

The background - the Falcon has 2 active serial ports, and uses the Bconmap
call to manage these ports. Unfortunately, there are a couple problems with the
Bconmap table, as generated by the TOS - even though there are 2 valid entries,
the counter says there is only 1. In fact it *needs* to say that there are *3*
entries, because the first *valid* entry is the *2nd* physical entry... The
first entry, which is reserved for the MC68901 (original ST) serial port, is
useless because that port isn't connected in the Falcon. (Even though, in the

TT/TOS 3.0 docs, it says you will always be able to rely on the ST-compatible port being present and usable. So much for promises... Needless to say, I believe this was a major mistake. The chip is still present, why didn't they just leave well enough alone and connect the damn thing, so that all existing communications software could continue to work without hassle...)

I suggest making two changes to correct this problem. First, update the Bconmap table counter to 3 instead of 1. There is a program BMAPFIX 1.0 by Don_Maple@kr.maus.de which does exactly that (available atari.archive and elsewhere). This will at least get your TOS's Bconmap function to respond, as opposed to its current behavior of shutting down the entire serial comm. support. The next change, which I suggested to Don but I don't believe he has yet adopted, is to overwrite the (useless) 1st entry in the table with the 2nd entry in the table. Then, when software tries to read or write from the nonexistent ST-compatible port, you will at least get *something* - you'll get the Falcon 9-pin serial port, which is pretty much what you would want to happen anyway. This whole patch takes about 3 lines of C code to perform; run it in your AUTO folder and forget the problem ever existed...

My notes are at home, otherwise I'd post the code right here. Maybe later today, if no one else has already...

Sounds like a nice project, I'd like to see it as well.

Of course, I wouldn't want to have to use it every day. 230kbps just isn't fast enough for a file-sharing network. It's barely fast enough for a dot matrix printer, and definitely not fast enough for laser printing. But I can see that it would be tremendously useful for folks trying to integrate into an already established Apple network.

That answers the problem; you're using the Atari-monitor adpater, not the
VGA/Multiscan adapter. If you use the VGA adapter you'll get all the modes
non-interlaced, and the monochrome-detect line is irrelevant. You need to use
the VGA adapter and a 15-pin VGA cable instead of the 13-pin Atari cable.

No it's a feature not a bug Ofir ;-) Take a look in the hisoft.ts
conference on CiX if you are a member, there's a good explanation in there.
i don't think there is any way to avoid it completely, but there are ways
of reducing its likelyhood (sp?) Most obvious being; don't send yourself
so many messages. The AES isn't too clever at merging redraws (in some
circumstances anyway). Scrolling (in the top window at least) is another
good candidate for cutting out the message pipe.

Have you tried running it a a .PRG before and after you use Creator? I suspect
the problem is that as an .ACC it is getting into memory problems.

On Mi - 28.07.93 - at 4:57 pmbjb@praxis.co.uk asked this:

B>I recently read somewhere about a screensaver called Before Dawn that
B>was similar to After Dark on Macs and PCs. Does anyone know anything
B>about this program, like where to get it and whether it's shareware, PD
B>or comercial.
It's a IMO great screensaver for all Ataris.
It features two parts: A TSR (for the AUTO-folder) and an ACC.
Included are three kinds of saving:

- "At the movies" : Lots of IMGs or XIMGs can be created to fill the
screen. Existing IMGs are Daffy Duck, the Macintosh
toasters, rotating Atari-Symbols an so on ...
They are konfigurated by an extra-file.

These animations can be konfigured by a program which is packed in the same
archive.

- "Warp 5 Mr. Zulu" : Stars or other stuff (again IMG or XIMG) seen from
the screen in the Enterprise ;-)

- "Bouncing hole" : A symbol ist moving over the screen and - when it
hits the border it bounces back.
The funny part of this module is that the desktop is
seen through the symbol. for example: a simple hole,
or - and thats REAL GREAT - the "Intel outside" -
logo.

Several interfaces can be controlled to stop the saving:
- MODEM 1/2
- Serial 1
- Mouse
- Joystickport
- Keyboard
- Midi
- LAN

If you use the *.MOD-player "Paula" (by Pascal Fellerich from Luxembourg)
You can listen to a *.MOD-song while the saver is active.

Before Dawn is released as "Fairware", which is almost like PD, but if
you send money the the author (Arne_Rudolph@ac.maus.de) you get a
registered version if the saver should get Shareware in a later Version.

Sorry, but I don't know where YOU can get (because I don't even know
which way ftp - and so on - works) :-((
But: The files named "dawn112u.*" and "dawn113u.*" are only update-archives in

which are only updated files included.
The complete archive is the one of version 1.11 (actual is 1.13)

Bye
Stefan

Well, if you've got an ST, you probably won't get much G++ done under
MiNT... not enough RAM if you're using tcsh. :-(

It might be nice to modify minixfs.xfs so that it only allows the gross
8.3 filenames, but uses the more efficient i-node structures instead of
FATs...

I imagine the ST is far too slow to deal with an MPEG file at an
almost-reasonable frame rate... The Falcon could probably do it at a
respectable rate _IF_ it used the DSP.

The plot sickens. I have a VGA monitor on the table next to the Falcon. I
got an adapter to connect it up, and I get yet another video selection
dialog, with the choice of line doubling or not instead of interlaced or
not. Also, the true color modes aren't offered. Also, the ST mono
compatibility mode seems to be slightly different from the one I get on the
multisync. I think I've heard about all these things before, but never
in terms quite as concrete as "with this setup I'm offered these options".

I think maybe I have to learn what happens with the M0 and M1 pins on that
connector, and make the appropriate switchbox.

Steve

================= quote on ===========
Cute. This system is real. It's called Jaguar. It looks a lot like 3DO.

o 2 32-bit RISC processors built by Motorla operating in parallel
o 24-bit graphics, 16M colors
o 32-bit DSP chip, 32-bit aux port for DAT and CD
o CD drive will be optional for another $200.

Of course, Atari is selling it, so you know what's going to happen...
==========================================

Actually, its a real 64 bit CPU, not 2 32 bit ones (or so I've been told,
unless Bob Brodie lied to us). And it has a 64 bit data bus (something the
next falcon should have, and I'd take a falcon if it was $200 more and had
the graphics capability and graphics speed of this Jaguar).

It can do 3-D polygons and shade and texture map them is real-time. Including
real-time rotations. Sounds great for 3D games and perfect for virtual reality!
```

1982. Objective C

Does anyone know if there is an Objective C compiler for the GNU Compiler? I'd rather go with Objective C than C++ (or G++). Also, would it be possible to create an Objective interface to GEM? Like the NeXT? Perhaps with a Dynamic Link Library (has anyone made a DLL system for MiNT yet?) or maybe a rewrite of the AES to be objective?

It also pisses me off that the AES polls everything. When you press a key or click with the mouse, it causes an interrupt. A keypress should find the application with the top window, giv eit the keypress, and then switch tasks so that when the keypress interrupt returns that application can deal with the key immediately. Same with mouse clicks. Of course, objectively, the "object" should get the events, not the necessarily the application. By task switching with the standard event interrupts I think the system would respond better and would at least seem faster, and should actually use less CPU time since you don't have to poll anymore.

In any case, I would like to learn Objective C for the ST, even if no one will ever fix the OS.

Yes it is but are you going to lend me the money to use it, its more like $200
plus for that service and its not Real FTP, its still just a mailer,
you request the files and they get them down at night...

I with the problems that I had with Actrix you can keep it, it would be
the worst system that I have ever used...

>

I don't think that the controller supports Parity, so stick to a drive that does not need it..

The ST157N can get a bit noisey at times, the earth spring on the end of the spindle can squeek, use a soft lead pencil and rub it over the spindle end, please don't bend the spring to far back, also some soft glue on the spring can stop it resonating..

At for a drive I don't think you can go past a Quatum LPS240S, fast and nice and quite and has a diable Parity option...

>
> Whose fault?
>
> Rob S. Rice
> rrice@mail.sas.upenn.edu

ARCshell 3.01 is way out of date and does not support the features of
the newer LZH2.22, from my past experience with ARCshell 3.01 it never
realy supported LZH201x at all...

I use Neodesk and run LZH from the command line, no switches are needed,
and it creates the folders ok...

Untill I find a real good Shell for all these archivers that its they it will
stay for me..

From what I have found there are a good many German Arcshells, but the problem
again is that I don't read German..??

Source record: 203112

I would like to get an old atari 520st w/ drive or stfm or 1040, here is a list of stuff i have to trade... Possibly you miss your old 8 biy sys and have an extra old st lying around...

Im willing to trade any item (items) on the list of equivilant value to an old ST..

Thanks

GCC 2.x compiles C, C++ and Objective C. Get it. You also need the
Obj-C library from the FSF. The FSF also makes dl, a dynamic load
system (they say it woks on Atari.)

Well, then what *did* happen with that money? Is it still there? Was
it reallocated to the Jaguar or some other project?

> This year, Atari has $40 million in the bank for the big advertising push
> they're going to do...

> Sounds like it's not money Atari's short of...

The only reason I think Atari may put out a decent marketing effort for
the Jaguar is that is seems Time Warner has given them a kick in the ass
to get them going.

Time Warner owns 25% of Atari, so the answer to "Who will win the 3DO
vs. Jaguar competition?" is obviously "Time Warner."

Atari's stock has gone way up, and there are some big names looking at
them right now. They've put all their eggs in one basket. I think if
Atari fails with the Jaguar, the company will almost assuredly go under.

(I know this topic is probably already dead, but our newsreader seems to
be at least 2 weeks slow!!!!)

>> Then again, "Why didn't they use SIMMs?", "Why didn't they use a
>> detachable keyboard?", "Why didn't they use a 33Mhz '030?", etc...
>> The ways of Atari are mysterious...
> nino> These questions have been discussed to death already in this
> nino> newsgroup, but once again:
>
> But it was a DUMB decision! Listen to your customers, Atari!

I agree that Atari needs to listen to there customers. In my experience
with users of MACs, IBMs (and clones), Amiga, and Atari; I find that the
average Atari or Amiga owner usually a bit more computer literate than the
average MAC or IBM user. I know MANY owners of PC Clones who know no more
about there machine that how to work a few applications while EVERY Atari
owner I know has written at least one simple program. The nonsense about the
Falcon being designed as a consumer machine is just absurd. The modular
design of a PC never scared anyone away. Todays computer consumer has
a preconceived notion that real computers look like a PC or MAC. I'm not
saying that Atari needs to look like someone else to sell machines, but that
the others do it because it makes sense.

> nino> - A detachable keyboard wasn't used according to Atari because
> nino> 1) The Mega STe and TT cases were not considered appropriate for
> nino> a consumer machine.
>
> But those cases are so great (especially the Mega case)! And they
> could have used SIMMs! and detachable keyboards. Even Macs (the
> ultimate expression of consumerism :-) have separate cases, detachable
> keyboards, and SIMMs nowadays...

Anyway, my point is that Atari seems to patronize its customers to
point that it is almost insulting.

> NO crummy headphone amp), standard SIMMs, a Mega-style case, space
> inside for an extra hard or floppy drive, a GOOD keyboard...

Though the 68040 may have been to costly, the standard simms, modular
case, and REAL audio I/O would be nice. The Falcon is being pushed
(among other things) as a great audio machine. Line level RCA jacks
would not have scared away anyone that was interested in its audio abilities.

(Though, I've not heard a Falcon's output, I've had enough audio experience to know that a headphone amp is just going to add distortion if used over a PA (or stereo) system. And the separate channel grounding of RCA jacks would help too). The VGA is already there, but using a higher speed pixel clock (like used in BlowUp030) from the beginning would have been cool.

> - lancer@wpi.wpi.edu - - Operation Ivy: -

> - an observation of the pitiful condition of our degeneration. -

I wish Atari all the luck, but I just can't see a company that does not listen to its customer base being very successful. I, myself, DO intend on picking up a Falcon030 with the next 6 months because I see great hacking potential, I like Motorola architectures and I'm tired of MACs and PCs because I use them every day at work.

Peace,

-Adam Conover.

The best thing to do is NOT send messages. Just call your scrolling routines directly instead of sending yourself a message to scroll. It should be faster that way too.

```
==================== quote ==================
I use Neodesk and run LZH from the command line, no switches are needed,
and it creates the folders ok...
=============================================

You don't need Neodesk, just install it as an application, this works for
most archivers out there. LZH2.21 (or 2.22 and maybe 2.20) is nice because
the folders are automatic and its about 5 times the speed.

==================== quote ==================
Untill I find a real good Shell for all these archivers that its they it will
stay for me..
=============================================

A shell isn't needed for extraction, subce most extract automatically.
And any CLI will do for creating archives, although STZIP works best for
me since I like it's built-in interface.
```

```
============= quote =====================
GCC 2.x compiles C, C++ and Objective C. Get it. You also need the
Obj-C library from the FSF. The FSF also makes dl, a dynamic load
system (they say it woks on Atari.)
=========================================
```

OK, I have GNU C (2.3.2 I think, 2.4.2 when BART gets working again).
Now, I thought that GNU C required G++ (another MB or so of archives)
in order to compile C++ code. Will GNU C compile C++ and Objective C
without these alternate "front-ends" ?? Or will I have to find a front-end
for Objective C.

I have contacted the FSF before when I was tracking down GNU C. They sent
me a little book that gave an InterNet address to contact, and he told me to
FTP a.a.u.e, and i later learned to use BART to get it. I don't remember
seeing an objective C library on a.a.u.e. Is it there, or will i have to look
elsewhere.

Any help is greatly appreciated. Thanks.

Gemview can deal with JPEGS, but, it doesnt use the DSP. Even on
the falcon, with an 030 (yes, slow at 16MHz, but still faster than
a 16MHz 68k), its pretty damned slow...

> Steve

This video mode dialogue is what you should normally see: you should
have double lines (interlaced, really...). True colour seems to be
only available in 40 column mode (heave... unless its my monitor
also?)

Have you run MTOS yet? And then check the video selection menu?
Only when you run MTOS, can you see three additional video
modes! TT low, TT med, and TT high. TT high is not available,
I think that needs one of those big 19" TT monitors...

Your right, this is odd, but I think its just Ataris way of
letting the computer deal with the myriads of monitors...
I think the best way to go is a SVGA non-interlaced monitor.
Mine is VGA non-interlaced...

: >or something else.
:
: Huh?
:
: He *has* renamed it to something else, viz. "Nethack--". Did you think
: the minus signs above were just added as punctuation?

I thought it was just punctuation, the longer form off the "-" sign
(forgotten what's it called) instead of Nethack minus minus.

: >There is a NetHack++ floating around with binaries for AmigaDOS and
: >MS-DOS
:
: Well, NH++ is actually an earlier version of NH--, but some pedantic
: person complained that "unless it written in C++, you shouldn't call
: it anything ending in '++'" (can you believe anyone actually demanding
: that? It's sad but true that there are idiots around...) and the
: obliging author promptly changed the name to NH--.

NH++ was based on 3.0 and was written I think by different authors. NH++
started on MS-DOS machines and NH-- was first out for the Atari-ST.

How about NetHack "author name" 3.1.3?

But I thought the author of NH-- based his version on an earlier version
of the NH3.1 as he said something about the Dev Team sneaking another
version out, which lead me to believe the -- was the long - and the 3.1.3
was his revision (one up from 3.1.2)

You don't even need an SVGA non-interleaced monitor, as that only
applies to 1024x768, which the Falcon can't do hooked up to one. (at
least the one I had here for a while couldn't. The best you're likely to
do is 800x600, if you get a ScreenBlaster.
The Falcon I had here had the 286 emulator in it, and it is quite
fast running Windows 3.1 for a 286, but the 800x600 is an interlaced
mode and completely unusable for any serious work.

> I'd like to know:
> 1: Can I replace the drive just like that?
Yes.
> 2: Can I replace it with a bigger or smaller disk (MB's I mean)?
Yes.
> 3: Does it need to be this Seagate with this type, or
> can the Megafile handle any other RLL disk?
No, and yes, the MF30 will drive virtually any other RLL drive with
a ST506/412 bus.

> 4: Do I have to low-level format a new disk, and how do I do that?
With HDX, you will have to add an entry to your WINCAP file before
formatting.

> 6: About the crash: the drive didn't want to spin two times.
> Both times I shook the drive quite firmly. The first time
> everything went fine, the second time most of the files
> became unreadable. Would a low-level format to this disk
> do any good?

What does "unreadable" mean? Did you find all partitions after
booting? I would try to recover the old drive (by testing
and maybe reformatting it) before buying a new one. And when
the drive doesn't want to spin up, don't shake the drive,
but just turn it (rapidly).

: >Atari fails with the Jaguar, the company will almost assuredly go under.
: where is the atari-stock at the moment. I'm interested in every change (up or down).
: Is there anybody who will post it every day?

It doesn't make any sense to agonize over the price of a stock every
day. If you have analyzed the company and you believe in the stock,
set up a low price (that you sell at in case it goes down), and a
high price (that you sell at in case it goes up). For what it's worth,
I have my thresholds set at -15% and +60% and that seems to work for
me. I check the prices once every couple of days, but my broker
has his instructions on when to sell.

You'll sleep a lot better.

Also, 3DO has a lot of big name companies behind it too. Atari still
hasn't said how much the jaguar will cost once you add a CD-ROM to it.
It will have to go head to head with 3DO's price. As of this writing,
3DO seems to outhype and outspend Atari at every turn. We all know
that in the American market hype sells a lot more boxes than technical
specs.

>
The reason it's interlaced is that it's not an SVGA. I am running now at 880*656 at 68.4Hz non-interlaced on my SVGA. I can even push it to over 900 if I wanted.

>Does anyone know what type of adaptor does Mega STE 4 house? My HD Utilities
>program says that I have a Seagate ST157N. I have it formatted to 45 megs.
yes, really the megste has the seagate st157n harddrive. It will give you
48MB

>I would like to buy a larger hard disk, say 200 meg but I don't know if I would
>have to get another HD controller to use with my new hard disk.
This won't be a problem I think. The harddiskcontroller is good enough for a
quantum 210 :-)

>Also, I find my Mega STE4 quite noisy. Is that the internal fan or is it the
>hard drive mechanism. Thanks in advance for any information.
you can get a new fan in it called pabst it is quiet and will fit instead of
the old one but the st157n is very loud so it will not bring the much :-|

bye, mike :-)

Hints from Emily Postnews
==========

(Thanks to John Henders (jhenders@jonh.wimsey.bc.ca) for this bit of _humor_.)

Emily Postnews Visits comp.sys.atari.st

(Due to popular demand, (well at least one persone asked anyways), Emily has taken time out of her busy schedule to answer a few commonly asked questions specific to c.s.a.st.)

Dear Emily.
Some Amiga user is raving on c.s.a.st about how wonderful
his computer is, and how awful mine is. What should I do?
signed My Computer is NOT a Toy.

Dear My Computer, etc,etc.
Many people's egos are so tied to their possessions, they
have to affirm their existance by raving about the superiority
of their machine to anyone who will listen. You should immediately
flame these people into cinders, using every rumour or misconception
you've ever heard about their brand of computer, as this will cause
lots of posts, and develop into a massive flame war, which is one
of the main reasons most people read c.s.a.st. If this didn't happen
every six months, everybody would unsubscibe to this newsgroups from
boredom.
Or, you could put comp.sys.amiga.advocacy in the Followup to:
line, and any article replying to yours would go to the newsgroup
designed for this discussion.
Or, if your newsreader supports it, you could build a KILL FILE,
which eliminates any post that has the word Amiga in it.

Kill files can be created in rn and trn by hitting the 'K' key.
This will make a kill file based on the article you were reading
at the time. Then control K will put that file in the editor for you
to play with. You use the same regexp commands here that are in rn.
For example. /[Ff]oo/h:j would search all headers of unread articles
for both Foo and foo, and junk them. Check the docs for your newsreader
for further details.

Dear Emily.
I like flame wars, and want to start one of my own, so my name
will be as famous as Richard Covert's.
Signed, Too much Time on My Hands.

Dear Too much time.
Sorry it took so long to reply, but Richard's in my kill file
and someone had to forward your post to me, or I'd never have seen it.

Flame wars are fun. They're the main reason people creted Usenet,
and should be encouraged at every opertunity.
Some of the most common tricks for starting flame wars are as
follows.
1: Post a note in another newsgroup telling all the users there that
they own a piece of junk, and if they had a half a brain, they'd have the
same computer you do, as it's obviously the best.
2: Toss a bit of slander against another computer in a totally
unrelated post. This guarantees a follow up, even if your original
post wasn't of any interest.
3: Create a signature file that has a put down of another computer
in it. This will get flame wars going in threads that have completely
unrelated Subject: lines, thus slipping through all but he most exacting
kill files.
I hope you find these tips handy in creating your next flame war.
And just remember, your computer MUST be the best, after all, it's yours.

:DEV: 93.06.11
How do I become a developer for the Atari ST?
==========

Contact Bill Rehbok, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Bill can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Bill for

more information.

Atari is now selling the developer's kit (or parts of it) seperately. No project-in-development or non-disclosure agreement is necessary.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6

What is Free-Net and how can I get access?
==========

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't

post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to
myself via the e-mail addresses above or by writing the SIG at its US
mail address:
The Atari SIG
P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

12 issue Subscription now:
With Disk 6 Mags Without Disk Mags

UK: #26.50 #18.00
Europe (air) #30.50 #21.00
World (air) #38.50 #31.00

Address: ST Club, 2 Broadway, Nottingham, NG7 1PS, UK.

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Future Publishing, Somerton, Somerset, TA11 6TB Tel. 0458 74011
Fax 0458 74378

Atari ST User:
---

like ST Format. Generally (amongst online users) thought
to be not quite as good.

ST Action:
---

games, games and more games. And games.

Atari ST Review:

Lots of info, more mature editorial style than Format, but not so
polished. 1 cover disk per issue.

Subscriptions: PO Box 500, Leicester, LE99 0AA. Tel: 0858 410510.

There are also, I think, some MIDI mags with strong ST content. I don't
have their names.

German Mags:

Atari PD Journal:

('Suspened' from publishing...)

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this
information, DP-Z]. Hardware and Software reviews, some commercial software
reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for
domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100
Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Bretonischer Ring 13, 8011 Grasbrunn, West Germany,
Phone: ++49 89 456 160

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

French Mags:

ST Magazine

Monthly in French. Oriented towards developers, professional users. Comes
with a disk each month.
ST Magazine - 10, rue Hegesippe Moreau - 75018 Paris - France
(French Teletel users: 3615 Teletel access, code STMAG)

STart Micro

Monthly, includes a cover disk. 11 issues per year. 64 + 16 (separated) pages.
Price: FF38 per issue, subscription: FF360. Subjects: Desktop publishing,
graphics, initiations to C and GFA Basic, survey of outcoming software, music,
folders. Minitel access: 3615 code ATARI. Address: FC Press, 57 rue Danton,
92300 Levallois-Perret, France.

Dutch Mags

ST, published by Stichting ST , postbus 11129 2301 EC Leiden the Netherlands
---
cover price: fl 6,95
Independent magazine by and for atari ST users.
covers all different topics from applications to games and hardware.
60 pages.

6 times a year. One year subscription fl 35,-
black and white pages.

Atacom, by Atari Club Groningen.

Never seen this one. I suppose you have to be a member of the club or so.
price is fl 4,95.
Adress of the club: Atari Club Groningen, Postbus 9164
9703 LD Groningen, the Netherlands.

Atari Nieuws, by Atari ST computer club Nederland

News paper sized publication. Lots of colour on newspaper pages. Not too many
pages though.
price is fl 3,95 (cheap cheap)
monthly publication.
adress: ACN, Postbus 5011, 2000 CA Haarlem, the Netherlands.

GFA-info, by GFA gg (usergroup)

Publication of the GFA-basic usergroup. This group has a lot of mainly
educational software available.
price is fl 5,00

adress: GFA gg, Frankrijklaan 14, 2034 BA Haarlem, the Netherlands

ST News, by Stichting Computers Eindhoven

This is an electronic magazine. It has been around for about 6 years now
and is completely in English!!! The first issues were in Wordplus format

back in 1986 but from the 6th issue on it included a readerprogram
both for color and monochrome. Even with music.
price is fl 10,00
adress: S.C.E., Kornoeljelaan 22, 5552 RC Valkenswaard

Swiss mags:

Atari ST News Schweiz

Dutch Atari ST Nieuws translated into German for the Swiss :-)

:TIPS: 93.06.11
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used
with the ST; the custom cable involves no tricks, or commercial ones are
available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are
tricky.

An ST-formatted disk which is not readable by a PC can be made readable by
putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning
of the boot sector (sector 1 of track 0). This can be done with
either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and
higher does this automatically.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced
by ST formatters. On those drives, ST-formatted disks are not readable,
independent of their boot sector contents. The other way, however, does
always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access
a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick
extender cable will make life easier. The Y-cable joystick extenders make
it extremely easy to keep mouse and joystick connected to port 0, and a
joystick extender cable in port 1 makes for easy hookup after you've moved
the machine.

BARREL is a program which can redirect printer-data to a file. It comes in
handy when your printer is unavailable, and the program does not already
have an option to 'print-to-a-file'. (It is available on the atari.archive
server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to
drive B. Handy when a program 'hard-codes' the data drive, and you
wish to use your hard drive instead. (It is available on the atari.archive
server.)

On the Desktop, holding the right mouse button allows
you to manipulate files in other windows. This is useful for a number

of reasons. An example is this: say D:\BLAH.ARC is a file you would like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then hold the right button while double-clicking ARC.TTP in an inactive window.

:ZNET: ??.??.??
Where can I get copies of ZNET?
==========

ZNET is now Atari Explorer Online. Please see EXPLOR for more info.

:EXPLOR: ??.??.??
Where can I get copies of Atari Explorer Online?
==========
Atari Explorer Online magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

Atari Explorer Online and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

:PD: 93.06.11
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ZIP, .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so. You may obtain uuencoded files as e-mail. You can obtain a help file by mailing a message to archive-server@spud.hyperion.com, with the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains a multitude of Atari ST PD and shareware programs. If you don't have access via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu, jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

```
begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end
```

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions to INFO-A16 are also available on this server. INFO-A16 is a digest of messages from comp.sys.atari.st.

:FTP: 93.05.05
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm to 8-9 am LOCAL time. LOCAL time means local to the computer you are accessing! For example, 4 P.M. in Minneapolis, Minnesota is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New York.

2. Once you connect, issue the following commands at your FTP prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

src.doc.ic.ac.uk

This site has a mirror of atari.archive.umich.edu in /computing/systems/atari/umich.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
TT, and Falcon. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.
```

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ARCS: 93.06.11
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC, .ZIP and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ZIP Use UNZIP.TTP or STZIP.PRG
ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

A few hints for first-time users:

* Most archivers will give a short summary of commands if invoked with no arguments.
* If in doubt, to extract a file, copy the archiver to the directory that the file is in, and run the archiver with the arguments 'x [filename]'.
* If you have TOS 1.4 or higher, and/or a CLI, you can avoid copying the archiver by just changing the current directory to where the file is. See TIPS for a tip on how to do this from the desktop on TOS 1.4 or higher.
* Read the documentation for the archivers you use, they will almost certainly answer all your questions. Documentation is usually included in both the source and binary distributions (such as zoo21bin.zoo).

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

stzip22.lzh - STZip, with GUI interface

unzip41.lzh - Old version of unzip

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using
zoo21.ttp.

:MSA: 93.06.11
Some info on Magic Shadow Archiver
==================================
(This was provided by Chris Herborth)

MSA Archives

The Magic Shadow Archiver (MSA) is a disk archiving program that allows an entire disk to be compressed into one file for transmission. The Magic Shadow Archiver (in shadow.[arc?|lzh?|zoo?] on atari.archive.umich.edu in ~/Archivers) creates .MSA files, which are often compressed using a normal archiver, such as zoo or lharc.

Magic Shadow is notoriously bad when used on a 1/2 meg ST and only one floppy drive. Its disk access and memory use are very badly thought out, and could result in over 160 disk swaps when unpacking an 80 track, double-sided disk.

Due to the fact that it was the _only_ disk image archiver around for quite a long time, Magic Shadow is the de-facto standard for creating disk images of computer demos and other pieces of software that cannot be easily compressed as files.

Because MSA files are disk images, they can only be used to recreate a floppy disk. There is (currently, see below) no way to extract the files from an MSA archive without writing it to a floppy disk.

Magic Shadow works perfectly with any legal TOS floppy format, even high density disks found in modified STs and most MegaSTes and TTs.

Chris Herborth (herborth@pinot.waterloo.ncr.com at work,
cherborth@semprini.tdkcs.waterloo.on.ca at home,
C.HERBORTH on GEnie) is writing a much more efficient MSA extractor, called UnMSA. UnMSA will minimize the number of disk swaps, and speed decompression considerably.

Daryl Richards (no email address, yet) is working on an MSA-Mounter, which will allow someone to unpack an MSA archive to RAM or a file on a hard disk. This uncompressed disk image will then be added to the system as a logical drive (much the same way a RAMdisk adds a drive to the system). MountImage on the Mac is an example of the way MSA-Mounter will eventually work (MountImage is so good, you can install new versions of the Mac OS using floppy disk images stored on your hard drive).

There is yet another MSA archiver now, called MSA II, by Phillip Lang.

:CLI: ??.??.??
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

master MS-DOS/Unix mixture, shareware.

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3

```
CRC error.....................-4
Bad request...................-5
Seek error....................-6
Unknown media.................-7
Sector not found..............-8
No paper......................-9
Write fault..................-10
Read fault...................-11
General error................-12
Write protect................-13
Media change................-14
Unknown device..............-15
Bad sectors on format.......-16
Insert other disk............-17
Invalid function number.....-32.....1
File not found..............-33.....2
Path not found..............-34.....3
No handles left.............-35.....4
Access denied...............-36.....5
Invalid handle..............-37.....6
Insufficient memory.........-39.....8
Invalid memory block address...-40.....9
Invalid drive specified.....-46....15

No more files...............-49....18
Range error.................-64....33
Internal error..............-65....34
Invalid program load format....-66....35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

Trap Instruction Vectors.....32-47
[unassigned, reserved].......48-63
User Interrupt Vectors......64-255
```

:GDOS: 93.05.05
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called SpeedoGDOS, which should be available commercially from Atari. It is currently included with AtariWorks, and some Falcon packages. SpeedoGDOS uses scaleable fonts - you do not need to create a font file for every point size. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within SpeedoGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

In the UK The ST Club (2 Broadway, Nottingham, UK NG1 1PS. Tel 0602 410241, Fax 0602 241515) is a licensed GDOS distrubutor:

Catalogue No's:
GDOS-A Driver + Fonts 9-pin
GDOS-B Driver + Fonts 24-pin
GDOS-C Installed system for Opus (9 pin)
GDOS-D Opus 24-pin
GDOS-E FontGDOS + drivers
GDOS-F 300dpi printer fonts

Disks 2.95 pounds each.

:GNU: 93.06.11
What GNU software is available for the ST?
==========

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at most European FTP sites. The latest version of GCC available for the ST is 2.4.2, this version includes built-in support for C++.

Note that most GNU documentation comes in TeXinfo format. Documentation in this format can be fed into TeX for printing. It can also be processed by Emacs' texinfo to make an info file, which can be viewed on-screen with Emacs' info mode. These two functions can also be performed by the standalone programs 'texinfo' and 'info' (on atari.archive as /atari/tex/tnxf241b.zoo).

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.4.2 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System

SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM: ??.??.??
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG: ??.??.??
Public Domain/Shareware languages...
==========

There are a large number of programming languages available for use with the
Atari ST. Programmers seem to flock to the Atari ST, and if you know of a
language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN

FORTH
FP
Hope
ICON
LISP
Little Smalltalk
Modula2
OPS5
perl
PROLOG
SCHEME
SIOD
Smalltalk
XLisp
XProlog
XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX: ??.??.??
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN
TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix
newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT: ??.??.??
What is MiNT?
=============
MiNT is a free multitasking operating system extension for TOS. It is somewhat
like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM
program along with a lot of character-based programs simultaneously. MGR
and MW2 can both put multiple terminal windows on screen, and bgacc can
put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go
with it can be found at atari.archive.umich.edu:/atari/mint.

TOSWIN is the new replacement for bgacc: it provides lots of nice features like
variable fonts, menus, selectable window gadgets, etc. GEMTERM is a similar
package (it's not part of the standard MiNT distribution) modelled after TOSWIN
and XTerm.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking
OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now
'MiNT is Now TOS'. :-)

:XWIN: 93.03.01
Is there a version of XWindows for the ST?
==

There actually is a port of XWindows to the ST now, although it is pricey.
Here's the (slightly hacked up) announcement for it:

X/TOS/window/server and X/TOS/window/server/color

Vendor:
X/software Michael Gehret
X/TOS division
Marktstrasse 8
W-8944 Groenenbach
Germany
TEL: +49 8334 1411
FAX: +49 8334 6245
email: xtosinfo@xsoft.uucp
CPU:
Atari Mega ST, STE, TT
68000 to 68040
Memory:
2 Mbytes (4 Mbytes recommended)
Operating System:
TOS 1.4 or higher
Mouse:

Atari mouse
Graphics:
X/TOS/window/server:
monochrome 640x400x1,
monochrome 1280x960x1 (TT, SM194)
X/TOS/window/server/color:
monochrome 640x400x1,
monochrome 1280x960x1 (TT, SM194)
color 320x200x4
color 640x200x2
color 640x480x4
color 320x480x8
Ethernet Card:
Atari Card (Mega or VME bus)
Riebl/Wacker (Mega or VME bus)
Biodata BioNet 100 II (DMA port or VME bus)
Network Software:
Atari/Riebl/Wacker ANS TCP/IP
Biodata TCP/IP
Disk Space:
none (two floppy disks, may load fonts from second disk or font server)
Features:
full X11 Release 5 implementation
Shape, Multi-Buffering, MIT-SUNDRY-NONSTANDARD extensions
PEX extension optional
support of font server protocol
support of X Display Manager Protocol
access control support
compatible to OSF/Motif and OpenLook
high performance (more than 32,000 Xstones on TT)
fast cursor tracking
backing store and save unders support
size of virtual screen limited by memory only, automatic panning
X/TOS/window/server/color supports all video modes at the same time,
including dynamic visuals
loadable key maps (xmodmap format), full support for European keyboard
layouts
3-button mouse emulation with Atari 2-button mouse
may run parallel to GEM (switching with hot key), configurable multi
tasking priorities
about 50 fonts supplied

:DEMOS: ??.??.??
Why won't demo x run on my machine?
==========

90% of the time, if a demo does not run on your American ST, you probably
need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from
atari.archive to allow this.

:PAINT: ??.??.??
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD: 93.06.11
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ZIP, .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@spud.hyperion.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu,
jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or
weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

```
begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end
```

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP: 93.05.05
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

```
user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>
```

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

src.doc.ic.ac.uk

This site has a mirror of atari.archive.umich.edu in /computing/systems/
atari/umich.

:TEX: ??.??.??
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.14) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request
to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The
latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0.
This consists of 8 disks full of TeX stuff, plus an installation program

that takes care of the details for you.

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments,
suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

Welcome to comp.sys.atari.st
==========

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe, TT, and Falcon. There are also emulators for the Apple Macintosh and IBM PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented. The newsgroup serves as a resource for Atari users ... feel free to contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics

comp.sources.atari.st ! uuencoded/shar sources

:MODELS: 93.01.30
All the models in the ST line
==========

This is a pretty complete list of all the ST/TT models and their main features. If you have any additions/correction, of course, send them to me.

Feature key:
CPU's:
8 8 MHz 68000
16 16 MHz 68000
16/3 16 MHz 68030
32/3 32 MHz 68030

RAM:
/1 128kB
/5 512kB
1 1MB
2 2MB
4 4MB
S SIMM slots for expansion

Built-in:
F Floppy
M TV modulator

Extra:
AV 8 bit digital stereo audio, 4096 colors, hardware scrolling, analog joystick ports
MB MegaBus processor-direct bus slots
6U 6U VME bus slots, second serial port
FC Motorola 56000 DSP, 16 bit stereo audio, much enhanced video

TOS:
Highest built-in TOS

Models:
Name CPU RAM TOS B.I. Extra Comment

:FALCON: ??.??.??
What are the specs on the Falcon?
==========

Here's some stuff I culled from the (reposted) Delphi conference with Sam Tramiel.

--- Start Quoted material ---
Here's the specs on the Atari Falcon 030:

CPU: Motorola 68030 running at 16 Mhz
32-bit Bus
Optional 68881 or 68882 FPU
RAM: 1,4, or 14 megs
Standard Atari Cartridge Port
Motorola 56001 DSP chip

Expansion Bus:

Internal direct processor slot for 386SX PC emulation, or other coprocessor

Graphics:

Super VGA graphics: 640x480 with 256 colors
True color 16 bit mode allowing a display of up to 65,536 colors
Accepts external video sync signal to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan on TV's and ST Color monitors
262,144 possible colors
hardware-assisted horizontal fine scrolling
BLiTTER graphics co-processor

Sound features:

Eight 16 bit audio DMA record and playback channels
Stereo 16 bit digital DMA input
Stereo 16 bit DMA audio output
SDMA sound/DMA Coprocessor

Standard Ports

SCSI II port with DMA
High speed LocalTalk compatible LAN
Connector for analog RGB color (ST or VGA) or composite video
RS232C serial port
Bidirectional parallel port
MIDI IN/MIDI OUT
Stereo microphone input, miniature stereo plug
Stereo audio out, miniature stereo plug
Two joystick connectors
Two enhanced digital/analog controller/light pen connectors

Data Storage

1.44 Mbyte floppy disk drive
Optional internal IDE Hard Disk

System software

Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)
Inter process communication
NewDesk desktop and eXtensible control panel
Multiple window user interface; number of windows limited
only by memory or software in use.
--- End Quoted Material ---

:ACCEL: ??.??.??
Hardware Accelerators
=====================
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

68000 based: ICD adspeed ST/STe
Fast Tech Turbo T-16 (16MHz)
T-20 (20MHz)
T-25 (25MHz)
68030 based: Gadget by Small SST (16MHz to 40MHz user changeable, 8 SIMM slot
68882 FPU socket, 1 expansion slot, TOS 2.0x).
Fast Tech : Tiny Turbo
Full size version

:DRIVES: ??.??.??
What should I know about hard drives and the ST?
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins IDC
connector, and usually say SCSI hard drive or Mac drive. (Any Mac except
Mac128, Mac512, FatMac has SCSI built in, so a drive that works with Mac
usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use
them you need an adapter to convert them to SCSI. Adaptec 4000/4000A
is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar cards
availible. Adaptec has stopped production for quite sometime so look for
these in used/liquidation place. (usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the
adapter to the host adapter. (said ICD). It looks like following:

```
-------------- ----------- ------------ ----------
| MFM drive |------->|ACB 4000 |------>| ICD |------>| ST DMA |
-------------- ----------- ------------ ----------
```

3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put
the drive internally, you will need a case with power supply to house the
adapter and hard drive. IBM case is very easy to get and has a lot of space
for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive
they use about 20 watts or less, Quantum LPS drive use about 10 watts each,
make sure your power supply has more than the drives need. Again if you
use IBM case, the 150 watts power supply for that type case can drive at
least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power sup
SCSI cable from host adapter to SCSI drive or adapter(for MFM/RLL),
it's 50pins IDC female connector on each end with 50 conductors
cable. Should be availible at place you get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should be
available at the place you get the drive).

Now, connect them all together. Before power up, check the connection again.
And check the jumper setting on the drive (consult the drive's manual). If you
are using more than one drive with the system, make sure only the last drive
has the terminator (either a DIP or a signle inline package of resistor, which
usually is socketed and close to the SCSI connector on the drive circle board.
Remove the terminator from other drives. [only the last drive should have the
terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5
from ftp sites.

:FLOPPY: ??.??.??
Can I use 1.44 meg floppy disks?

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe
and TT machines. If you own an older Atari ST, there is a company which offers
a $199 kit (including floppy) to install and use the drive. (I will supply
the name next month, sorry...)

Note that Tos versions prior to 2.05 will not format a 1.4 meg floppy from the
desktop.

:GRAPHIC: ??.??.??
How can I enjoy enhanced graphics on my ST?

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on
older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass
at listing some of them. The information is based on postings by Ben Gilbert
and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different
graphics boards available, from hobbyist to professional, from CAD
to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync

monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome
* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Here's a few more cards, available from OverScan GbR, Saentisstrasse 166,
1000 Berlin 48, West Germany, ++49 30 721 94 66, ++49 30 721 56 92 (FAX),
++49 30 727 05 6 (Mailbox, language: German)

Autoswitch OverScan for the ST (NO STE compatibility) is DM 129.--, you
don't have to buy a new monitor. The maximum resolution on a SM 124
is variable, but in most cases at about 732*480.
AutoSwitch OverScan TT is a VME board. It's about 249.-- DM, you also can use
your old monitor, but it only works in the TTs five color modes
(3 ST-compatible modes, 2 TT-modes). Resolutions are variable, ask
OverScan about the values for your monitor.
Falcon ScreenBlaster blows up your Falcons resolution to a maximum of nearly
900*600 on SVGA-monitors. It'll be shipping as soon as Falcon030s
become available, and the pricing will be near 150.-- DM.

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:JOY: ??.??.??
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable units"

:MODEM: ??.??.??
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOOW to you!

You will probably need a serial port patch program to use high speed modems on your ST; most versions of TOS have a bug in CTS/RTS handling.

:MONITOR: ??.??.??
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150, used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM: ??.??.??
How can I turn my Atari ST into a PC emulator?
==========
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

Supercharger is the only external PC emulator with 8MHz V30 and 1MB RAM in a nice lunch box. It connects to ST's DMA port and defaults as device 3. It's powered by external power supply. Has 8087 socket and one expansion slot. The 1MB RAM can be used as RAM drive by ST when the IBM side not used.

:SPECTRE: ??.??.??
How can I turn my Atari ST into a Macintosh emulator?
==========
(Thanks to Wayne (trek@ihlpb.att.com) for this info.)

Product: Spectre GCR from Gadgets by Small, Inc
40 W. Littleton Blvd
#210-211
Littleton, CO 80120
Retail: $299.95

Description:
The Spectre GCR is a combination of software and hardware that allows the Atari Mega/ST/STe/TT line of computers to emulate an Apple MacIntosh Plus(tm) Computer. The emulation is so good that most Apple software runs out of the package using your Atari Disk drives to read in the Mac software. It does all of this while running 20% faster than the program would on a MacIntosh Plus and provides you a 30% larger screen area.

The Spectre GCR is a combination of software (written by Gadgets by Small, Inc), a cartridge (also from Gadgets), and a pair of 128K Apple ROMs (from either a MAC 512kE(tm) or Mac Plus - part numbers 342-0341 and 342-0342 which you purchase separately from an Apple source.) The Apple ROMs can currently be purchased for around $150. MacIntosh documentation and software, including the operating system (referred to as System/Finder), are also required to round out the package.

The Spectre software is currently at release Version 3.0. Gadgets supplies fairly frequent updates to allow you to keep up with the Apple OS releases.

The Version 3.0 update retails for $20. Version 3.0 supports 15 of the 128K OS releases up to, but not yet including System 7 releases.

Spectre software supports Mac formatted disks (including formatting your own) with your Atari drives, Mac sound, large screen displays (1280x960) Mac harddisks via SCSI through a Megatalk board (retail $299.95 from Gadgets) or through an ACSI-SCSI host adapter (my Syquest works beautifully- and the excessive use of disk accesses in Mac software will have you wanting a hard drive). Spectre 3.0 also supports DOS Mounter and Apple File Exchange if you are needing MS-DOS data disks for Mac work. Language configuration support, keyboard support, A4 paper size support for Lasers have also been added to 3.0.

Running Spectre:
The feeling you will get when you see your Atari transformed into a MacIntosh with a decent screen is indescribable. The extra flexibility that you get will also make you feel more confident in the greatness of your Atari. You will also get to see some of the frustrations with one of the other sides of the fence - frustrations like excessive disk access, remembering not to remove/change a disk unless the OS tells you to, etc.

Speaking of changing disks, there are major differences in the operating philosophies of an ST and of a MacIntosh. You really must read the documentation that comes with the Spectre GCR (and I for one found that a real delight. Dave and Sandy have a very different approach to software documentation that makes it enjoyable reading.) You should also read the Mac Operating System docs. One other reference you may need if you are going to do much with Mac software is one of the reference manuals referred to as the MacIntosh Bible.

If you ask an Apple dealer if a particular piece of software runs on a GCR, don't figure you will get a straight answer. They won't know. The current compatibility list from Gadgets lists about 450 programs and their release numbers that have been tried and found to work with Spectre GCR. In general, if a piece of software won't work with the GCR, it is probably becuase of copy protection. Most serious Mac software is not copy protected.

One last note - earlier versions of the emulator exist that were not capable of reading Mac disks directly. It's a capability you will want.

(Thanks to Shoou-yu Tang (sytang@lamar.colostate.edu) for this info.)

Spectre GCR is the best availible, you need to obtain a set of 128KB ROM from Apple (they are used in Mac 512KE and Mac Plus, noted that Mac512 use older 64 KB ROM which is not good) to fully utilize the device. Also it's recommanded to use it with MONO monitor and at least 2MB RAM. The Spectre software takes about 300 some KB of memory, so on a 1040 there is not very much left for Mac, especially after the Mac system is loaded. 4MB memory and MONO is best.
It can read/write Mac disk direct using ST's drive (double side drive, as most Mac drive is double side). With DOS mounter or software like that you can read /write ST, IBM disk from the Mac desktop as well (don't try to run the ST, IBM

binary. It's only for file transfer). Or you can use Apple File Exchange to read/write ST, IBM disk.
Syatem 6.0.5 runs fine, system 6.0.6, 6.0.7 runs also. But system 7 will not run with it.

:UPGRADE: ??.??.??
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for about $150 from CodeHead

2030. Fastest/Most compatible LZH?

Newsgroup: comp.sys.atari.st
Date: 1993-08-02 16:01:43 UTC
From: boyd@sonya.math.fsu.edu
Message-ID: <CB536w.Lyt@mailer.cc.fsu.edu>
Source record: 203060

Ok, I have been using lzh201l.ttp (the latest Quester version to my knowledge) for some time. In the past, I have found different lzh extractors with major incompatibilities, so I have stuck with 201l for some time.

I noticed a post comparing the new 2.20 with Quester, and mentioning a version 2.21.

My questions:

Is this new lzh 2.2x 100% compatible with Quester?

Is 201l really the latest Quester version?

Does 2.2x conform to the Quester command line structure, or the older lharc structure (i.e. should "Quester Mode" be set in Arcshell).

smug is the word. The first virus I encountered came on a Mac operating system upgrade from Apple. Macs have always been notorious for viri. I've had an ST since 1987 and have yet to encounter a virus (and I sure hope things stay that way).

Smug ex-atarian comments belong in advocacy however; that is the purpose of that group.

Here's something I snarfed from rec.games.moria a year or so ago. I'm
posting it since I think it's of general interest. Enjoy.
++

From the Book of Usenet, Thompson 5:11...

,-,
|A|nd so it came to pass that the alumni, the graduates of the places of
'-' higher learning and knowledge, were shorn of their FTP access, and
were unable to access the many games thereby, and there was much wailing
and gnashing of teeth.

,-,
|A|nd one of the alumni despaired, and spake before the assembled masses:
'-' "Canst thou tell me of the way, that I might find my favorite game?
I am shorn of my FTP access."

,-,
|B|ut the masses did not know the way, and there was much silence.
'-'

,-,
|T|hen a voice rose from within the crowd, saying: "Come hither, and ye
'-' shall learn the secrets of FTP by mail." And the crowd hearkened to
that voice, and gave it a space, for there was much desire to learn the
secrets of FTP by mail.

,-,
|"|Send a message to ftpmail@decwrl.dec.com with the word 'help' in the
'-' body of the message, and ye shall receive a list of commands that
may be sent to this magical daemon. Thy requests shall be queued, and
verily I say that the files you request shall arrive at your mailbox in
the space of a day's time." The crowd marvelled at this, that the secret
should be so simple and easy, yet so little known.

,-,
|"|Have a care, thou must also knowest the secrets of 'atob', 'compress'
'-' and 'cat', for thy file may arrive compressed and in parts, and thou
must re-assemble, decode and uncompress them. Yet this is a minor task
to the likes of thee, worthy alumni." A murmur ran through the crowd at
this news: Some despaired yet again, having gone to places of learning
that did not teach these secrets. Others spake of ways to surmount these
difficulties, while still others paid them no heed whatsoever.

,-,

```
|A|nd so the masses dispersed, each to attempt to magic of FTP by mail,
'-' and in the days that followed there were many attempts made, and some
of these led to files, and others to error messages, and still others to
gibberish which the receiver could not comprehend. And there was some
despair, and some confusion, yet for the most part the files were received,
and it was like unto a miraculous work, for the masses had ever lost hope
of using FTP again.
,_,
|A|nd there was much rejoicing.

I have had my ST for less than a year now, and I have had two seperate instances of the 'mouse inversion' virus on some disks. Once on Sim City that I purchased used at a swap meet, and lately from a .msa file. It all depends on how un-lucky you get. The best think to do is be suspicious of any new disk that you add to your collection until you run a virus checker on it.

Atari's stock went way up when people noticed a huge number of shares being traded. If you looked closely, however, those shares being traded were Jack Tramiel selling some of his position to his sons.

>>and noticed that (probably) AES frooze. I guess it was because of a
>>message queue overflow. I was scrolling through a text window keeping
>>the mouse pressed... this caused a lot of redraw messages.
>>
>>So, is there a way to check the message queue, avoiding it to overflow?

I want to sincerely thanks all people who responded to the
question concerning overflowing GEM message queues:

pjj@cs.man.ac.uk (Pete Jinks)
comeau@crc.sofkin.ca (Phil Comeau)
ogal@cix.compulink.co.uk (Ofir Gal)
apelled@cix.compulink.co.uk (Adam Pelled)
evanlang@sdf.lonestar.org (Evan Langlois)

As Mr. Pelled correctly pointed out, the specific problem can be
avoided by directly calling the redrawing function instead of
sending the redraw message to AES (and thus getting queued in
the AES message pipe).

The reason I posted the question was first of all out of curiosity
since the overflow of the message queue could happen in other
(unexpected) circumstances as well. But also since I believe that the
method to send the application redraw messages instead of executing
them locally (possibly all over the place) is elegant since:

1. AES promises to merge these events with other
redrawing messages, which will gain efficiency

2. The structure of the program will be cleaner and
thus the maintainability will improve since the
machinery is stired from one place
```

I have a related question concerning redrawing ICON type objects which
I've posted to comp.sys.atari.st.tech. I feel that the previous
question should have been posted there as well, I'm sorry that I didn't.

Thanks again for your thoughts,
Jan van der Steen

==========
Well, you've obviously got something set up wrong then. Have you got
caching enabled on the FAT disk and not on the minixfs one?

minixfs is approx 2x faster in general use on my system.

==========

I have done tests with and without caching, and with both uncached, the GEMDOS one is faster, and newer MINIX drivers test slower, although I don't have the latest. Also, MINIX XFS driver has its OWN cache, and I haven't messed with it at all. Is there a way to increase the cache (without making an extra program to make an FCTRL call and sticking it in my MINT.CNF file, I hate trillions of utility programs that need to load in).

What version of TOS do you use? 1.0 and 1.2 and even 1.4 are all MUCH slower than 1.62, with 1.0 being abysmal. If you use 1.0, then MINIX is likely faster for that reason. My 1.62 (which is actually about the same as 2.06 without Newdesk) is much faster on the GEMDOS level. This COULD be the difference. Also, I have a VERY slow drive, with horrible access times. Perhaps the FAT system is better on slow drives (it would be if the MINIX one needs to access more non-contiguous sectors).

I'll do a re-test later when I get the newer MINIX.XFS and maybe I'll increase the cache, but caching shouldn't be a problem if BOTH are not cached.

2050. Re: MPEGs

GEMVIEW 2.30 came with a program called Multidialog, or it was SUPPOSED to.
I got the folder, and the README, but no program. Its supposed to put any
dialog box into a window so that you can still access the menu-bar and task
switch. Does anyone know where I can get this?

Also, can anyone tell me about WINX and WINNI?? One of them said it modified
the AES and would read from ROM or a disk image. It wouldn't work with my
TOS 1.62 ROMs nor my TOS 1.0 disk tos that I keep. The other just opened
some windows, but it was in German, so I don't know what it was supposed to do.

Thanks
email reponse would be best.

```
====================
This video mode dialogue is what you should normally see: you should
have double lines (interlaced, really...). True colour seems to be
only available in 40 column mode (heave... unless its my monitor
also?)
====================
```

No, interlaced makes 400 lines out of 200, doubling makes 240 lines out of 480, so they are opposite effects. TV monitors need interlace to get more lines and VGA monitors need doubling to get fewer lines (which looks better than the real thing, since doubling doesn't leave scan-line spaces). I need a way to access BOTH monitor types since I have an NEC 3D (no Falcon yet :-)

True Color is only available in 40 column or interlaced modes since the falcon is limited to around 8M Longwords/second of video bandwidth or around there, and 640x480 in true-color in too much I think.

I was always wondering why my mouse flipped when I used certain disks...,
I just assumed it was a funky TOS bug. Either way, is there any PD software
that will kill this, and will it do any serious damage to my system if I
take my time killing it? (I have a MegaST 1.02, soon to be MegaSTE.

Well, although the sound quality isn't as good as Smooth Talker's, that PD program (STSPEECH.TOS) can be used from GFA BASIC. I have the code somewhere, but unfortunately it only works with v2.0. (And only from the interpreter.) I could disassemble a compiled Modula 2 program, see how it accesses STSPEECH.TOS, and possibly make that usable from GFA. (BTW, the prgram is that talking formatter.)

2055. UPLOAD: nh313gem.zoo - Full-colour GEM NetHack 3.1.3

Newsgroup: comp.sys.atari.st
Date: 1993-08-03 04:45:44 UTC
From: warwick@cs.uq.oz.au
Message-ID: <14668@uqcspe.cs.uq.oz.au>

(Changes list at end of message)

NetHack 3.1.3

Graphical GEM Version for Atari Computers
REVISION A

by Warwick Allison
warwick@cs.uq.oz.au

No longer do you have to play NetHack with silly character graphics!

OVERVIEW

This port of NetHack gives you full-colour graphics, plus a
completely GEM user interface. Not to be confused with the hackfnt
technique of simply changing the font, THIS version gives you
16x16 pixel, 16 colour graphic icons for EVERY OBJECT IN THE GAME -
that's about 850 different icons.

REQUIREMENTS

Being a GEM application, this game will run in many graphics modes,
however it is by far the best when played with:

- 16 colours
- AT LEAST 640x480 pixels

This means that the game is not really playable on the standard modes
of old ST, Mega, and STe models. It will, however, run in such modes,
but with most of the playability lost. Run it in ST-medium to the
see basic interface, then run it in ST-low to see the neat graphics...
then try to imagine what it is really like...

and get a Falcon, a TT, or a graphics card.

This version also requires at least 2 MEGABYTES of RAM: the program
itself is more than 1M, and the graphics consumes 350K.

THE DISPLAY

There are 3 windows, initially placed in the order:

- Message window
- Map window
- Status window

The Message window is a scrolling window of messages. Make sure you keep an eye of these messages - they mean the difference between death and maybe death. Note that it works a little different from the normal NetHack message display: you will always see the most recently output messages. New messages are initially displayed in large text, but become small when no longer current. If too many messages arrive a "MORE" window will pop up - prompting you to read the messages, then press return.

The Map window is where all the action happens. It is a scrolling window, although in 640x480 modes, you can see the full height of the map, and half of the full width. It scrolls automatically as your player moves around the map, and can be manually scrolled with the GEM scrollbars, or by using the arrow keys. You may select to have a box around your player by choosing the "Map cursor" menu item - this is most useful if you drink a potion of invisibility!

The Status window is exactly as appears in the traditional character-based NetHack. I won't go into details of NetHack itself - read the NetHack documents for that information.

THE CONTROLS

Both mouse and keyboard controls are available at all times.

Experienced NetHack players will generally use the keyboard 95% of the time, but it is handy to have the GEM menus at the top of the screen for those less-often used commands.

The GEM menus have the keyboard equivalents displayed with them, so the beginner can quickly learn the more common commands (selecting 'Get' will drive you crazy if you don't learn that ',' is the keyboard equivalent).

The map can be clicked on to move the player around, but this gets VERY tedious. Use the numeric keypad (8 directions) to move the player:

```
N
|
7 8 9 5 = self / rest
```

W-4 6-E Shift-number to move in that direction until a corner.

```
1 2 3
|
S
```

When scrolling about with the arrow keys or scrollbars, the HOME key will return the view to your player.

During pop-up dialog boxes, the UNDO key will ALWAYS end the interaction with a non-response (usually undoing the activity without effect). The ESC key also ends interaction in MOST pop-ups. It doesn't end a "get line of text" pop-up, because the standard GEM user interface uses the ESC key to clear a field. You would agree with me that you don't want ESC to cancel the pop-up when you are asked to wish for something...

Also in pop-up dialogs, keypresses can be used to select options - just use the keys depicted in the pop-up. The RETURN key selects the heavy-outlined button, as per the GEM user interface.

Pop-up dialogs may be dragged around the screen by clicking and holding on the background blue area of the dialog. This is especially useful when you think you've read a create monster - just drag the pop-up so you can see what happened the instant before it popped-up.

CAVEATS

Currently, if you read a blessed scroll of genocide, you will be asked what "class" of monsters to exterminate. In the character-based NetHack, this simply means you get to wipe out all the monsters represented on the screen by a given character! So, in order to use such a scroll effectively, you will have to read the on-line help to get a bit of an idea what monsters are in each "class" if you want to know what to wipe out.

HISTORICAL NOTE

You may notice a resemblance in some of the icons to those in the old EPYX game called "Rogue". I have deliberately drawn similar characters for some monsters, so as to give a feeling of homeliness to those players who have spent hours playing the EPYX "Rogue". However, be clear that this game is not IN ANY WAY endorsed by EPYX, nor is any of the graphics in this game copied from the EPYX "Rogue" graphics.

USER SERVICABLE PARTS - for experts

The graphics used by the game are contained in 4 Degas Elite picture files (.PI1) in the data directory. It's probably best not to look at them too soon - it'll spoil the game a bit to see all the graphics, but I've provided them in that format so that if you don't like my picture of a Rust Monster (yes, I know they are supposed to be red), you can change them.

The resource file for this game may be edited quite extensively to customize the interface. Of course, ALWAYS keep a backup of the original RSC if you start changing things. ALL MENU BAR ITEMS may be moved around, deleted, etc. the keyboard equivalents must remain unchanged - it is those that are passed on to the NetHack system. So, for example, if you don't like the way I have ordered items in

```
the "Here" and "There" menus (I certainly don't like the ordering),
you can move them to under other menus, and change the text of the
item, provided you leave the keyboard equivalents the same.

------------------------------------------------------------------------------

---------------------- NH 3.1.3 GEM - Revision A ----(this release)-----
NetHack 3.1.3 base used.
ST-specific help file added to Help menu.

---------------------- NH 3.1.2 GEM - Revision A ----------------------
NetHack 3.1.2 base used.
Message window changed to ensure ALL of EVERY message seen (Wrap, "MORE" pager).
Text and Menu windows vertical scroll with UP and DOWN arrows.
Full colour graphical RIP tombstone.

---------------------- NH 3.1.1 GEM - Revision C ----(previous release)-
Flying dialogs added.
Support for graphics cards vastly improved.

---------------------- NH 3.1.1 GEM - Revision B ----------------------
Ensured "LEVELS" and "SAVE" subdirectories are in archive.

---------------------- NH 3.1.1 GEM - Revision A ----------------------
Initial GEM port of NetHack 3.1.1.

2057. Omniswitch for sale

Newsgroup: comp.sys.atari.st
Date: 1993-08-03 06:00:10 UTC
From: u833@rex.uokhsc.edu
Message-ID: <CB660A.C6M@rex.uokhsc.edu>
Source record: 203087

Hello, I was moving this last weekend and ran across a couple of pieces of hardware from my old Atari 520ST. I thought I'd post and see if anyone was interested in them.

Omniswitch by Talon Technology
-switches between color and Monochrome monitors with 1 switch
-converts standard atari video to IBM type multisync plug
(both 9pin and 15pin)
-composite video out
-audio out
-switches between 2 floppies as floppy B:
-includes monitor video cable (color) and floppy drive cable to go from box to atari

I've only used this with an old ST model and none of the newer machines.

I'll be happy to sell it to some deserving soul that'll put it to better use than my trash can as that's the only other place I know to put it.

So leave me mail if your interested. $40 would be fine with me.

hi!`
I'm reading interested the discussion about mpeg on atari and now it is time to grin about this :-) because in the moment i'm working on a sparc2 at siemens and i'm programming at an mpeg-player. the speed on the sparc2 (26mips) is incredible slow (8bit colours) and on the sparc10 (86!mips) a gray-dithered videosequence (8bit gray) will decode approximately 3.5 pictures per second. look this is for realtime applications too slow and won't be much better in the next times. Maybe the jaguar will deal with it (150mips).
mike :-)

2062. FLASH II

Newsgroup: comp.sys.atari.st
Date: 1993-08-03 06:34:59 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <23l0ujINN12s@golem.wcc.govt.nz>
Source record: 203084
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi I have just had a play with the latest version of FLASH II,
I just got the Patches down from GEnie for a friend, it is
now upto version 2.11...

I have never realy played with it before, the reports that I read
about it and the comments from Alan Page put me right off,
Alan mentioned that it had the same flaws as FLASH 1.6..

I as I had the latest version I though that I would give it a try out...

Yuk it has more Bugs than Features, the Zmodem is SLOWWWWWW 1000cps
with a 14.4bis modem, I normanly get 1640, the screen writes are slow,
no support for sending a ESC key code, used on many BBS's, its used as a clear
key, no support for C-Kermit, only Kermit, and you have to manualy select
Terminate after logging off a BBS...

From what I have read the Zmodem is a old version taken from the PD source
code that has been posted around, there is a TX delay after each TX block..

So Please were can I get a real GOOD Terminal program, Connect
is no good, no support for medium res, and Stalker is very slow and has some
bugs from what I can make out...

I like the Flash concept, the only one that has come near is Trapido...

Roger.................. sheppard_r@kosmos.wcc.govt.nz

2063. AIM 3.1

Newsgroup: comp.sys.atari.st
Date: 1993-08-03 06:41:50 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <23l1beINN12s@golem.wcc.govt.nz>

AIM 3.1 does not work in Low Res Colour..

all I get is a load screen and a bee after it loads..

This was tried on a 2.5 meg STFM and a 4 meg STE..

a friend also got the down from the same place cs.tu-berlin.de
and has the same problem with a 1040 STFM...

My copy does work on a mono monitor....

the LOW.RSC file is there and sounds like its being loaded..

Is this a Buged Version..??

Roger..... sheppard_r@kosmos.wcc.govt.nz

As the v2.2 manual says, (but the v2.1 manual did not say), you need to
put the word `color' in the options field of the printer setup dialogue.

I have done this, then got colour files correctly viewed using GhostScript,
although I do not have a colour printer for the ultimate test.

SL does not support PostScript out-of-the-box, you need the DataFormer module
(which is quite expensive). From DMC (in response to a similar question
from me):

"You require the optional Dataformer module to output about 17 extra file
formats, which include PS/EPS."

>in terms quite as concrete as "with this setup I'm offered these options".

The fact is you can't do true-color modes in 80 columns on a VGA monitor. The
only way the Falcon can do it is with interlace which is only available on
an RGB monitor (SC1224 or equivalent), at least with the standard monitor
adapters and desktop video stuff. So no, there isn't anything wrong with
your monitor, you have to use 40 column for true color.

How is the ST monochrome different? It should still come up with 640x400x1bit
on a VGA monitor as well as an RGB or monochrome (it's interlaced on the RGB
monitor). If the display is "squished" you can just adjust the monitor
controls to stretch it out again.

>
>I think maybe I have to learn what happens with the M0 and M1 pins on that
>connector, and make the appropriate switchbox.
>

Well, that depends what you're trying to do. On a VGA monitor you get up
to 640x480x256 colors (and anything less than that of course with 256 or
less colors) and also true color in 320x240 or 320x480. If you get a
ScreenBlaster or similar device and you have a multisync monitor (or SVGA
at least), you can get higher resolutions. I routinely run my Falcon at
832x624x16 colors or 800x608x256 colors, and that's without any external
hardware at all, just a program in the auto folder. With external
hardware you get those higher modes but with a lot better refresh rate.

Hi,

If you have TOS 2.06, I need your help.

I need two people to beta-test the new version of MasterBrowse. There may be some problems with TOS 2.06, but there is no way for me to confirm this without more than one test-machine available.

So, if you are interested in testing the new version, please send me a message at ess@PUCnet.com right away!

(No experience is required - if the program bombs, there is something wrong. If not, not. I know where the problem SEEMS to be, but it could just be the computer the program was tested on. The testing itself would take less than twenty minutes.)

Be sure to send a break-down of your system, AUTO folder, and installed accessories with your request to beta-test.

The biggest risk is the fact that the virus replicates itself by writting the virus code into the boot sectors of a floppy disk. If it writes itself onto a disk that has actual boot code...

I used V Killer to detect and remove the virus. V Killer is great virus detection/removal software. It even gives a description of the virus if it recognizes it. It is available on atari.archive.umich.edu (I think).

No support is a little overstressed. In fact it runs pretty well unter
medium res but its not that nice as in higher resoltions. At least
CoNnect's internal Z-Modem is very fast. On a TT or Falcon it rates
up to 11000 Cps when null-modeming on a 115200 line.

What and where can I find such a program? I found something a few
weeks ago, on the Znet BBS. Forget the name, but the README file
stated something to the effect that the program isnt fully tested,
and since it deals with non-standard rez, it could damage your
Falcon and/or your monitor... needless to say, I didnt run it...

Date: 1993-08-03 13:11:14 UTC
From: lancer@ramanujan.WPI.EDU
Message-ID: <LANCER.93Aug3131114@ramanujan.WPI.EDU>
Source record: 203153

I'm looking to upgrade my 1040STf.

I've got some SIMMs (256k and 1 meg) sitting around, so I thought a RAM board would be a good idea. Anyone have one to sell? Or any suggestions?

Also, I'm looking to upgrade my old TOS 1.0 ROMS to at least 1.4. Can anyone offer some pointers on this? Should I get a switchable TOS board? Do I need a special board to upgrade? i would assume so...

thanks,
.s.

About four years ago I had this virus too. I luckily discovered it
before it had done any damage, but I am interested in what it would
have done if I hadn't caught it in time. Supposedly this is the most
widespread virus on the ST. Atari ST Niuews in the Netherlands claims
that there are more than 1.5 million copies of it. Sounds like the
pingpong virus on the PC.

FOR SALE: MUST sell, ATARI ST system, 2.5 MB RAM, 84 MB HD, Word Perfect...

All of the items listed below for $450 O.B.O.
Best offer as of 8/13/93 takes it.

Hardware:
Atari 520ST (TOS in ROM) ...
External DS/DD drive, Atari SF-314
Mouse, Best Electronics
Joystick, Standard Atari (2)
Eazy-ST 2 Meg Ram Upgrade (total 2.5 Megs)
Monochrome Monitor, Atari SM124
Monitor switch box, Astra
Color Monitor, Atari SC1224
1200 Baud Modem, Atari SX212
Hard drive case, 3-5.25 inch bays/power/fan (Tech Spec.)
Supra Hard SCSI controller with clock
84 MB hard hrive, Seagate ST-296N, 28 ms access
1-Joystick Wico "Bat Handle"
Star NX-10 9-pin dot-matrix printer, extra ribbon, Epson/IBM

Software:
WordPerfect 4.1 (excellent spell checker and thesaurus)
Pagestream 1.83, with 16+ PD fonts
LDW Power 2.0 (Exports Lotus format)
G-Plus, Codeheads
Mavis beacon Teaches Touch Typing
GFA Draft Plus
F-16 Falcon (upgraded to hard drive installable version)
Stealth (telecomm software)

Atari Explorer, several years
ST-LOG
START numersous issues, many with magazine disks

Public domain software:
About 25 megs total on hard drive
Much duplicated on floppies
Utilities of all kinds
.IMG clipart
.TNY color pictures
Many excellent public domain games
Lots of GFA basic source code Included on hard drive

Everything in excellent condition. No known problems.

Prefer to sell as a unit. Actual shipping charges on most items -- or pickup in vicinity of Flint, MI (about 1 hour drive N. of Detroit).

That's only $450 o.b.o.

Please contact via e-mail.

>
>Jim, if you're out there I want a full refund. Enough is enough!

Jim is not out here, he refuses to try internet, but his GeNie address is J.ALLEN27. It is the only way to get ahold of him. I should say that Jim Allen and I are not on good terms. It took a *long* time (over 6 months) to get my T25, and I only got it after getting ahold of Nathan at ISD (he is head of IAAD also). Amazingly enough, I had my T25 withing 5 days then! Jim is a LIAR LIAR LIAR LIAR, I warn everyone not to purchase a single product from him.

First, I asked two very specific questions about the T25;

1) Did it work *completly* with the Spectre GCR
2) Did it work *completly* with the ISAC card

his answer to both was an absolute *yes*, "NO PROBLEMS AT ALL". Guess what... He knew very well that the card did in fact cause problems with *some* Spectres and *some* ISAC cards. In my case, it works properly with neither of them! To use Spectre disks I have to return to 8mhz, and it causes screen glitches with the ISAC. He knew about both of these problems, and when I asked he should have said "There are occasional problems".

Also, he repeatedly lied to me about my T25 being "in the mail". It was never in the mail, not until I got IAAD after him.

Finding that there really were problems which he *lied* to me about, I demanded a refund. He repeatedly refuses to refund my money. Also, he has said I could send him my machine to him and have it repaired within a couple days since he knows how to fix both the problems I have. I can't believe he expects me to be stupid enough to send my machine to a guy who has repeatedly and purposfully lied to me?!?!?!? I may never see it again!

I believe he lives in the Boston area, I am going to be in that area in about 6 months, and I'm simply going to take my machine over and have him fix it while I watch.

I doubt you will get your money back, and I doubt you will get your T25 if you don't get ahold of someone like Nathan.

However, I should say that the T25 is extremely fast. I had AdSpeed also, and the T25 is much faster even than AdSpeed, especially in the Video areas. If you get one and it works, I think you will be pleased with the speed it provides.

Is this a typo?
I'm using QED (v3.02), it's great.
You may define your own shortcuts (K"urzel) thus typing
bd(esc) leads to \begin{document} in TeX-Mode.

I've written a ps.krz and mailed it to the other, because I don't
want to type things like setlinejoin (or was it ...joint) every time.
Now i simply type slj(esc).

It supports GDOS (no printing, only smaller fonts)!

BTW, QED is shareware by Tom Quellenberg

> bugs from what I can make out...

I use Uniterm 2.0e015 and the GEM sz.prg rz.prg package (the one that is included with rufus or Connect, I cannot remember). I wrote two small macros to invoke sz and rz from the Uniterm popup menu. It works great for me.

Uniterm is the best vt100 emulation I have found in any terminal program (on any type of pc). My only complaint about Uniterm is that it uses its own custom drawing routines to improve upon vanilla TOS calls. I would like to be able to disable this behavior (as Neodesk allows you to do), and let Warp 9 speed things up. Uniterm's drawing routines are quite fast, but I would bet that Warp 9 could do better.

As about 80% of the time I spend in front of my ST is spent modeming into the systems I administer, I feel that I have given Uniterm (and GEM rz/sz) a pretty good test. I have yet to find any bugs in this setup. As all the stuff is readily available via ftp, I suggest you check it out.

Here's a blast from the past:

Out of nostalgia, I bought a used copy of StarGlider 2 for the PC.
I used to have the Amiga version years ago. One thing missing is the
keyboard chart. Does anyone have a keyboard chart for StarGlider 2
that I could get a copy of?

I know that several of the keyboard keys activate parts of the game
you can't get to otherwise. Amiga or ST keyboard charts should be
similar to the PC, I think.

Any help would be appreciated.

Thanks,

- Ted Drude (tbdrude@infonode.ingr.com)

For a TOS based text editor, check out Elvis (a vi clone). It is extremely
powerful, implementing everything in real vi, plus heaps of extras. It comes
with full documentation of the myriads of features.

There is a GEM based test editor in the CS-TEX distribution.

>
>===============
>
>I have done tests with and without caching, and with both uncached, the GEMDOS
>one is faster, and newer MINIX drivers test slower, although I don't have the

Since the MINIX drivers always seemed a lot faster to me, I thought
I'd do a couple quick tests. One was extracting a zoo file, and the
other was copying a large number of files. Both tests were done from
tcsh (i.e. the copies were done using "cp"). The results are as follows:

minix partition GEM partition

zoo 16 sec 34 sec
copy 6 26

I am using TOS 3.06. The GEM partition was cached with CACHE100;
the minix partition with the standard caches.

A possible reason for you getting less performance from the minixfs
could be that the driver was compiled using the "ROBUST" option.
(I think this was the default for some of the earlier version 0.60
releases.) Try checking the config.h file for a line with
"#define CACHE_MODE", change it to TURBO if it isn't already set
to this, and recompile.

Last I heard the Jaguar was susposed to be released in New York and in the SF area at the beginning of the month. Well, uhe beginning of the month has come and gone, and I have'nt seen any, or heard of any around. What's the deal? Did they set a later date? (Imagine that, Atari delaying the release of a product) Unfortunately I can't get the inside scoop on products anymore since my dad quit Atari a couple days ago and also now lives in Pennsilvania.

2095. High Speed Modems

Newsgroup: comp.sys.atari.st
Date: 1993-08-04 03:53:00 UTC
From: wojci_g@pavo.concordia.ca
Message-ID: <3AUG199322531972@pavo.concordia.ca>
Source record: 203172

Hi,

Presently I am using Freeze Dried Term and the highest setting for computer to modem flow is 19200. Are there any programs for my Mega STe (mentioned the name because of 16 Mhz) that support the 38400 and 57600 bps? The highest throughput that I get with my 14.4 v42bis connection is in the 1650 bps BUT would it be right to assume that with data compression by the communicating modems I should get a rate of 57600 bps between my STe and my modem? Hmm, can the flow rate of my Mega STe go above 19200 bps?

Wojo (wojci_g@pavo.concordia.ca)

Doesn't the MF30 have a scsi host adapter and then an adaptec 4070 scsi-st506/st412 RLL converter (or the OMTI version which was better (1:1 interleave instead of like 1:2)) If so, then you could use a SCSI drive, which are still made, more readily available, cheaper (unless you find someone dumping an old drive), and faster.

: Alan mentioned that it had the same flaws as FLASH 1.6..

: I as I had the latest version I though that I would give it a try out...

: Yuk it has more Bugs than Features, the Zmodem is SLOWWWWWW 1000cps
: with a 14.4bis modem, I normanly get 1640, the screen writes are slow,
: no support for sending a ESC key code, used on many BBS's, its used as a clear
: key, no support for C-Kermit, only Kermit, and you have to manualy select
: Terminate after logging off a BBS...

Hmmm, this message can't be correct. I use Flash II every day with unix computers. Using sz and rz on a unix system with a 14.4 modem on both ends I get 1600+ xfer rates all the time. Occasionally I may get slower speeds but that isn't flash. V.32bis modems occasionally will back down the transfer rate if the line quality is bad. My modem supports a speed status at command. One time I noticed my transfer rates were slower than normal so I type +++ and check the status. My modem was communicating with the other modem at 7200 baud if I remember correctly. Also Flash II has no problems with the esc key. Lord knows using VI I go ballistic if the esc key didn't work. And as for screen updates. The speed isn't quite as fast as the old flash or uniterm but it certainly couldn't be called slow. I've tested the screen update speed on my system with warp9 and find that it will just fall short of keeping up at 9600 baud.

Now there are some bugs and problems but so far Missionware has been very responsive in correcting known bugs.

UniTerm has still problems with double height characters and reverse
scrolling in scroll regions. Sure it is a very good vt100 emulation but
CoNnects vt100 has proved in many tests to be superiour. Concerning
speed up by Warp 9 CoNnect also will allow significant results there
as it completely relies on GEM and VDI.

>of text without needing a magnifying glass - there's not a lot of point!

I think we had this discussion already. As CoNnect is able to use GDOS
fonts even without GDOS its just a question of you beeing able to install
a proper GDOS font for 80x24. There exist fonts which are very readable
even without magnifying glasses.
Obviously you still haven't been able to read the online help in the
new version of CoNnect on how to install the fonts though the online
help is in English.
Taking this into account I really don't know how to help YOU. But there
are other very contempt medium res users haven 80x24 (without using
magnifying glasses) and it would be very kind of you stopping this
statements as this seems to me to be some personal problem of you.

Hi!
Heard of the new Atari-Computer?
It is a TT-clone developed by GE-Soft (Germany):

Motherboard with MC68030 50MHz
the whole board will run with 50MHz(!)
It has a lot of ports and slots:
Midi
DMA
Rom
DSP (!)
MC68040 (!!)
2xVME
ISA (6.25MHz)

The Memory-data:
up to 64MB Fast-RAM (with 16MBit-Simms up to 256MB)
up to 14MB Video-RAM

Resolutions:
ST-high
TT-mid
TT-high

Project-Name: EAGLE

MF-II-keyboard

Infos you can get at:
GE-Soft
Landgrafenstrasse 37
53842 Troisdorf-Oberlar
(GERMANY)

It will be avaiable on market early in september.

mike :-)

I am not sure, but I *think* that V42bis uses compression to get 14.4 over 9.6 links.

I had a similar problem, attached to a modem at 19200 bps using kermit - I got 2400 bps

I solved the problem by increasing the transmit window (the number of frames before acknowledgement is required). I now get 12800 bps.

You could try something similar with your program. Hope it helps :-)

2106. pack/depack on the fly?

Newsgroup: comp.sys.atari.st
Date: 1993-08-04 09:37:58 UTC
From: dmcdulin@cs.uct.ac.za
Message-ID: <CB8ArB.546@cs.uct.ac.za>
Source record: 203190

Well, having uploaded JamPack4 to a.a. recently, I now want to know if anybody knows how to pack data "on the fly" as it were. I know that with JamPack4 you can have depack data "on the fly" but not the other way around. If there are any public domain/shareware programs that do this, can somebody let me know where they can be found???

And if there isn't a public domain program to do this, I might be tempted to modify JamPack4 to do this, but *ONLY* if there isn't such a program in pd or shareware...

Email welcome.
Thanks
Barry

Wolfgang...NO NO NO..!!!

What we wan't is a REAL Comms program, one that can do 80 * 24 using
the System font with medium res...!!

On the lines of FLASH 1.6-2.22 not what you are trying to fource us to use,
when you give us a FULL screen option with Connect then I will buy it, so
please don't dictate what we wan't, we are the users..

If FLASH/TRAPIDO can have a full screen so can Connect, so please give us what
we wan't..??

I have found no one here that likes Connect at all, we have been used to FLASH
for so many years and FDT is used here a lot also, so you need some thing that
is better than those to sell here, Connect is not better its that simple...

2.22 was released some days ago.

>My questions:

> Is this new lzh 2.2x 100% compatible with Quester?

More than 100% because some bugs of Questor were fixed. Chris used the
Sources of Questor and optimized them.

> Is 201l really the latest Quester version?

Yes.

> Does 2.2x conform to the Quester command line structure, or the older
> lharc structure (i.e. should "Quester Mode" be set in Arcshell).

There are some changes. But it is really silly to use any Arcshell where
you cannot configurate the command line parameters. But you won't need
an Arcshell:

Packing: Drop a folder 'test' on the LHARC.TTP. test.lzh will be
created.

Unpacking: Drop an archive 'test.lzh' on the LHARC.TTP. The archive will
be unpacked into a folder 'test'.

Works fine for users I think.

The Falcon can play and/or record 4 tracks at the same time. Check D2D Edit
and Cubase Audio.

Yes. The data flow would increase on text files. Try Connect or Stalker,
both can connect at the higher speeds the MSTE supports.

If you get TOS 1.4 you just need to check whether you have a 2 or 6 chip set. It just plugs in. TOS 2.06 needs an extra board installed. 2.06 is nicer and you can also switch back to 1.0 for the odd game that won't work.

I do sugest that you read some of the Files on GEnie, the Archive
round table ones about FLASH II, many of the comment are about the slow speed,
Zmodem also problems with the the ESC key, so I don't think that I am making
it up, try placing the ESC key command into a Auto log on script...

My modem Supra, tell me the speed that I am connected at, I also tried
using FLASH 1.6 and RZ/SZ 3.4 and got 1600 cps after loging off with FLASH II..

My Post here was just confirming the comments that I have read on GEnie...

ConNect (2.10i) can go up to 19200 baud on modem port 1, and theoretically up to 153600 baud on modem2 and serial2. I say theoretically because the MegaSTe itself can only send/receive the data so fast at 16mhz. I have, null modeming on serial 2, gotten rates like around 3000cps doing zmodem between my MSTE and 10mhz 286. A TT should push at least 7000cps I'd imagine.

I believe STalker can also do the higher bauds and ports, but I haven't tried it out personally (I have tried Connect though for the above stuff).

In article <CB5wow.324@sdf.lonestar.org>, evanlang@sdf.lonestar.org (Evan Langlois) writes:

} I have done tests with and without caching, and with both uncached, the GEMDOS
} one is faster, and newer MINIX drivers test slower, although I don't have the
} latest. Also, MINIX XFS driver has its OWN cache, and I haven't messed with it
} at all. Is there a way to increase the cache (without making an extra program
} to make an FCTRL call and sticking it in my MINT.CNF file, I hate trillions of
} utility programs that need to load in).

One for Steven, not for me :-)

} What version of TOS do you use? 1.0 and 1.2 and even 1.4 are all MUCH slower
} than 1.62, with 1.0 being abysmal. If you use 1.0, then MINIX is likely faster
} for that reason. My 1.62 (which is actually about the same as 2.06 without
} Newdesk) is much faster on the GEMDOS level. This COULD be the difference.
} Also, I have a VERY slow drive, with horrible access times. Perhaps the FAT
} system is better on slow drives (it would be if the MINIX one needs to access
} more non-contiguous sectors).

I have an STe (TOS 1.62), and I have a Quantum drive (9ms, 1Mb/sec) as
well as an ST506 drive (40ms, 400k/sec). The minix fs is faster on
both drives. In fact the spped up is greater on the slow drive....

} I'll do a re-test later when I get the newer MINIX.XFS and maybe I'll increase
} the cache, but caching shouldn't be a problem if BOTH are not cached.

Seems to me you've covered all the variables - unless there are
auto-folder programs that are interfering...

Simon.

|> mike :-)
|>
|>
Hi Mike!

I have to dissapoint you and your sparc machines a little :-) bit!!
On my Falcon I have got a demo called Birdy.prg which plays this well-known sequence using the DSP. The demo is by Brainstorm, France (don't know their full adress). And FACT IS: IT DOES AT LEAST 15 FRAMES per second!

You ask why? The explanation is easy: Your Sparc uses Floating point operations to perform the mpeg decoding. This is quite a lot work for a normal sparc machine. (The MIPS number means nothing: M eaningless I nformation P rovided by S alesmen!!!) The DSP 56001 uses fixed point arithmetics, which is a lot faster. And then the mpeg-algorithm itself: It is strongly related to Fast fourier transforms (as much as i know, i am no mpeg expert) and in this algorithm THE special instruction of the DSP "mac" can be used. This instruction SIMULTANEOUSLY performs one 24x24->48 bit multiplication, one 48+56->56bit addition, TWO parallel moves including reverse carry adressing mode (indeed VERY fine for FFTs!). This instruction takes (as all instructions) 2 clock cycles. The Falcon DSP runs at 33MHz Clock speed. For the above operation this results 16*4=64 Million Fixed Point operations per second. To replace this instruction with a sparc and especcially to simulate the reverse carry adressing mode you need lots of cycles. And Floating point operations rarely will execute faster than 3 cycles each!

Another comparison: Here at the university we have got HP 9000/720 running at 50 MHz Clock. I've tried out a public domain mpeg player, played the file mjackson.mpg

Here is the (commented) ouput of the program:
609 /* Number of frames */
Done!

Real Time Spent (After Initializations): 26.989618 secs.
Avg. Frames/Sec: 22.564232

This is not too bad, is it???! The HP-PA is already known as a good floating point machine, and it shows...

Cheers,

Michael Eberl,
eberl@informatik.tu-muenchen.de

2122. 1 Meg ceiling required for some programs - why?

Source record: 203197

I have a program called "Fractal Engine" from one of the ST Format cover disks. I could not get it to run on my 4 Meg STe (2 bombs), although it ran fine on my 1 Meg ST. I decided to try the 1 Meg program that tells the STe it now has only 1 Meg, and the Fractal Engine ran fine. What is it about some programs that they require a 1 Meg ceiling? Why would a programmer insert this constraint? (or could this be an indication that somewhere in my 4 Megs I have bad memory?) I know RR Tycoon requires this 1 Meg set-up, but I don't understand that one either. I'm slowly teaching myself 68000 assembler; is memory management tricky with the ST/STe?

I've heard of good results with both the JRI and New World SIMM expansion boards. TOSs your 1.0 version in favor of 1.4, the only incompatability I encountered was with the game Arkanoids, and some where I have/had a patch to fix Arkanoids. All you have to do is remove the old ROMs and plug in the new ones, make sure you get the 6 chip set.

Brian

2128. Starting tcsh under MultiTOS??

Newsgroup: comp.sys.atari.st
Date: 1993-08-04 13:58:54 UTC
From: saj@chinet.chinet.com
Message-ID: <CB8Mu7.HuH@chinet.chinet.com>
Source record: 203005

More on the continuing saga of trying to make my new Falcon a comfortable machine to use:

I have what I think is the latest version of tcsh (whatever version, pl3) in f:\bin. I have files named login.csh and tcshrc.csh all over the place, along with a few files named cshrc.csh. (all over the place means, in this case, f:\bin, f:\etc, f:\usr\bin and c:\multitos). When I open f:\bin and double click on tcsh.ttp, it starts up fine, cheerfully ignoring all the potential startup files I've left around for it. What should I do to change that behavior? (yes, this is with a FAT filesystem. I'm still very nervous about installing a MINIX filesystem on a 20 MB partition, and I'm not in any great hurry to re-partition the disk).

Steve

>What we wan't is a REAL Comms program, one that can do 80 * 24 using
>the System font with medium res...!!

This is your needs for a comms program. This, however, does not
mean that Connect is not a "real" comms program, only one that doesn't
suit your needs. I've found many features in Connect that suit *my*
needs much better than other terms, but that is my situation...

>On the lines of FLASH 1.6-2.22 not what you are trying to fource us to use,
>when you give us a FULL screen option with Connect then I will buy it, so
>please don't dictate what we wan't, we are the users..

Uh, who's forcing you to use anything? That's the beauty of shareware:
you try it out, and if it doesn't suit your needs, so harm done. And if
it does, then things are cool. On a stock [Mega]ST/e, running in
mdeium with Connect probably isn't the best thing in the world. Running
in mono (as I do) is quite comfortable, and I'd imagine using one
of the TT/Falcon's modes would be downright great. A full screen option
would be nice, but then you may lose some of the other features of
Connect (this would apply mainly to MegaSTe/TT/Falcon users who
can have different serial ports connected to different windows at the
same time - something a little trickier to do in one screen).

On Wolfgang's point of view, he would have to find it so that
"if a full screen option were present, then Connect would significantly
be enhanced and sell better." If he's getting a good response
already, then he may see no need to add it. It would be nice to have,
since that seems to be the specific complaint about Connect, but
as for now ain't so.

>If FLASH/TRAPIDO can have a full screen so can Connect, so please give us what
>we wan't..??

See above paragraph. What Wolfgang would have to weigh would be the
advantages of adding a full screen mode vs his windowed mode. The
windowed mode would work better for multitasking systems, which Atari
seems to be headed towards. Of course if the demand were there,
then perhaps a lot more registrations would come in if the option
were present.

As a note on full screen. Before I switched to Connect, I was an
avid Uniterm user - it was (and really is) one of *the* best term
emulators, at least in the VTxxx realm. It was full screen. When running
under MultiGEM, I could use Uniterm, but I would have to switch to

the "drop-down menu mode" (hit the HELP key) to be able to switch to
some other task. This was a pain, but it did allow the multitasking.
Who knows, that could even be an option if Connect were given fullscreen...

>I have found no one here that likes Connect at all, we have been used to FLASH
>for so many years and FDT is used here a lot also, so you need some thing that
>is better than those to sell here, Connect is not better its that simple...

Um, a little presumptious, eh? :-) I've learned one thing - it's
dangerous to generalize a group of people, because some
smart aleck (me for instance :-) proves the rule is not correct.
Anyways, I like Connect a lot, mainly because it suits *my* needs.
I have a MegaSTe, and like to use the higher baud rates of the modem2
and serial2 ports - Connect lets me do this. Connect lets me change
the fonts, which is nice (you could use Warp9 to change the system
font when under Flash, for instance, but the fonts would take up the
same space). I multitask under MultiGEM, and am planning on getting
MultiTOS and/or Geneva - for me Connect seems to be designed to
work under such an environment. The unix-shell is helpful to me,
and various other options are also nice. The fact that I can do just about
anything in Connect *with the mouse* (rather than having to hit function
keys, etc) makes life more convenient for me. My needs are met and
exceeded.

And I do run Connect under a variety of situations: BBS's (VT52 and
ANSI mode), unix boxes (VT100 mode), GEnie, etc.

Your primary need (from your message) seems to be full screen. As such,
Connect doesn't suit your needs. That doesn't mean it's useless,
just not of use to you. If anything, Wolfgang may wish to find a
more tactful way of saying this, but the idea is there...

I do have Flash 1.6 in my collection of stuff (store bought, along with
a couple other disks of misc shareware terms that I don't really use)
and I just didn't take to it. It's hard to describe, but it just
wasn't what I was comfortable with. And so, Uniterm was my choice for
awhile. Does that mean Flash is worthless? Nope. Just not useful
to me...

Yes. I changed my 60M for a 30M at one stage, and put the 60M in a PC!
You will need to reformat, so dont worry about error messages the first time
you power up. (I had to try the format a couple of times before it worked)

> 2: Can I replace it with a bigger or smaller disk (MB's I mean)?

Yes, no problem, but it must be RLL to work correctly.

> 3: Does it need to be this Seagate with this type, or
> can the Megafile handle any other RLL disk?

Dont know. It should work with others...but knowing Atari.....

> 4: Do I have to low-level format a new disk, and how do I do that?

Use the standard hard disk utilities that you have.

> 5: Are these RLL drives still for sale?

RLL drives are still around. Flee markets have them by the cartload, or
new from most PC vendors. (I have found it best *NEVER* to say its for an Atari
though. Even for my Atari PC 286 clone, pc shops said "it wont work with Atari"
but it did!!!)

> 6: About the crash: the drive didn't want to spin two times.

Sounds like the second time you had a head crash. Never jolt a working drive!

2134. Compilation error when compiling MiNT

Newsgroup: comp.sys.atari.st
Date: 1993-08-04 18:57:40 UTC
From: pp@krynn.solace.hsh.se
Message-ID: <PP.93Aug4205740@krynn.solace.hsh.se>
Source record: 203007

I get the following error when I compile MiNT on a gnu cross-compiler on a
sun-3:

First I have to remove all the
from the endings of the lines just to get
it to compile the first .c file.

Then I have to rename raise in all the files to something else (gnugurka)
cause else I get conflicting definations (something...) (don't know if this
is the right thing to do... but anyway...)

Then when it come to the file genmagic.ttp it compiles it for Atari... and not
sun-3, so I have to do that manually, it compiles asmtrans.ttp in the right
format though... (I have to compile genmagic with -I/ pointing at the MiNT
include files to get it to work to.. but I think it makes the right output
anyway)

Then finally comes the error I haven't figured out how to solve yet...
(hang on a sec here.. I'm compiling it again just to get that error again :-)
/home/pp/Atari/cross-gcc/bin/cgcc -G -Wall -O2 -fomit-frame-pointer -mshort -o mint.prg

2135. SIMMs in an ST?!?!

Newsgroup: comp.sys.atari.st
Date: 1993-08-04 19:29:15 UTC
From: lancer@wpi.WPI.EDU
Message-ID: <LANCER.93Aug4192915@wpi.WPI.EDU>
Source record: 202760

Can someone tell me more about those RAM boards for STs that use SIMMs? Xtra RAM's looks good at $79 (from MC Computers or Toad), but I'd like to know more before I buy... For instance, which SIMMs can these boards use? I ask mainly because I have a lot of Mac SIMMs around here and I want to know if I will be able to use them in my ST... Also, is it possible to modify the ST to take SIMMs without one of these RAM boards?

Thanks...

Perhaps a section on RAM upgrades should be included in the FAQ...

2136. For Sale: Magnavox Color Monitor for Atari ST

Newsgroup: comp.sys.atari.st
Date: 1993-08-04 19:48:59 UTC
From: lch3e@holmes.acc.Virginia.EDU
Message-ID: <CB931n.I1v@murdoch.acc.Virginia.EDU>
Source record: 203012

Magnavox 8cm-515 color monitor w/ custom cable for Atari ST.

Better than Atari; 14" (vs. 13), better made, useable with

IBM-comp's, Amiga, and composite-video machines (Atari 8-bit,

C=64, vcr, ld player) as well.

Includes $40 custom 8' cable for Atari ST; separate sound

jack for running sound thru stereo.

FANTASTIC picture when used w/vcr or ld as hi-res tv; better

than any tv-set! Ideal for one needing both monitor and tv

in a small space. Can even have BOTH on and switch between!

Excellent condition.

$275 + shipping.

] I think we had this discussion already. As CoNnect is able to use GDOS
] fonts even without GDOS its just a question of you beeing able to install
] a proper GDOS font for 80x24. There exist fonts which are very readable
] even without magnifying glasses.

Anyone want to tell me where to find one?

] Obviously you still haven't been able to read the online help in the
] new version of CoNnect on how to install the fonts though the online
] help is in English.

It's pretty difficult to get it wrong! Put the file in the GEMSYS folder, put the filename in ASSIGN.SYS, and it's loaded. However, none of the fonts I have are usable in anything less than 10-points! Speedo-GDOS fonts are a lost cause, the smallest they are usually readable is about 12-points! :)

It's a good little program, if I had a faster machine (GEM's speed doesn't help things), and a good 8-point GDOS font, I might use it.....

> there are some very contempt 80*24 users......

My point exactly..... 8-) (Sorry!)

>Comments Please any one...!!!!
>
>
>
> < access...
>
>
>_____
>_____

I can quite clearly remeber this point being answered by a couple of
people. The point is that *MOST* people *CAN* access atari.archive
through FTP. If you look back at the postings in this group in the last
couple of months, you will see quite a few comments to the effect that
people have had trouble connecting to a.a (This means by FTP!!!) because
it is so busy!! This suggests that a lot of people *ARE* using a.a quite
happily, totally unaffected by BART's problems. Just because *you* can't
access a.a does not mean "most people" can't access it!!

>I know this statement could upset the people on A.A. but I thought
>that the Atari community deserve a far better mailer than the one that is
>presently used on A.A. , I thought this the MAIN ATARI/ARCHIVE FTP site,
>but it has the worst mailer..

By far the vast majority of FTP sites that I have come across (I'm not
just talking about the handful of ones with Atari stuff on them) do not
have any associated mailserver at all! The standard thing to do if you
are one of those wanting stuff through mail, is to use one of the
ftp-mailservers which connect to _any_ site and send the stuff back to
you via mail. ftpmail@decwrl.dec.com is the most famous of these but
there are others. If you don't understand the way things like this work,
read the newsgroup alt.internet.services or the book "Zen and the art of
Internet". The information is out there but you have to look for it.

>I don't know what other peoples fealings on this, but I have stuck my head out
>in what I think...

If you still don't know what people think, you can't be reading what people have been saying!!!! I can't put it clearer than that.

>Why can't A.A. implement the same kind of mailers that are used on most
>European FTP Sites...

I don't claim to be the correct person to answer this, but a couple of things stand out. First, atari.archive is not the only archive based at umich.edu, therefore I guess resources there are likely to be quite stretched at times. Secondly, a.a is staffed and run by volunteers who have to implement these sorts of things themselves. The fact that there is a mailserver just for the use of the atari community is itself quite unusual, the one at tu-berlin and others like it in europe, are used to cover the complete FTP site, not just the atari area.

Cheers,

>
>If FLASH/TRAPIDO can have a full screen so can Connect, so please give us what
>we wan't..??

For a comms program to do what flash/trapido (or Uniterm for that
matter) does, it needs to reserve the whole of the screen for itself.
This makes it extremely unfriendly to the newest developments like
Multi-TOS etc. Atari is telling developers to either use GEM with
windows, or totally the opposite with TOS text programs (so that they can
be run inside windows with smaller fonts), so that they can run in
multi-tasking and mixed interface environments. Older types of program
will only run properly on the older computers. This is a fact of life!!
Therfore you can't expect someone like Wolfgang who is trying to make
the next great comms program for today, to go the way of the old ones!!

>I have found no one here that likes Connect at all, we have been used to FLASH
>for so many years and FDT is used here a lot also, so you need some thing that
>is better than those to sell here, Connect is not better its that simple...

No-one where??? This newsgroup is often full of people saying how much
they like it!!! If you mean nz, well I for one like it, even though I
havn't got a powerful enough machine to fully utilise it. CoNnect even
so completely beats Flash or FzDT. They are just not able to handle the
ANSI/VT-100/102 stuff adequately for me.

Cheers,

First of all, could someone verify this TT-Clone business (no offence to the original poster, but I have trouble believing this).

But if it's true, I'd say it's rather good news. Maybe a little competition would make Atari pay attention to its customers a little more. And if they don't pay attention, I would (if I had the money) just as happily buy a computer from GE-Soft as from Atari--I like the product, but I've lost any loyalty to the compayny.

>Now, I thought that GNU C required G++ (another MB or so of archives)
>in order to compile C++ code. Will GNU C compile C++ and Objective C
>without these alternate "front-ends" ?? Or will I have to find a front-end
>for Objective C.

The same compiler does all three. You will need a few sets of
libraries to be able to do anything with C++ or Objective C.

The smartest place to look is prep.ai.mit.edu. This is the home of
GNU, and you should be able to find what you want there. (Not
precompiled, source only. But if your GCC is working, compiling the
libraries is a breeze).

2153. QD Play v3.1 available on atari.archive

Newsgroup: comp.sys.atari.st
Date: 1993-08-05 00:20:43 UTC
From: dmb@case.ai.mit.edu
Message-ID: <23pjorINN7ve@life.ai.mit.edu>
Source record: 203026

I've just sent QD Play 3.1 to atari.archive.umich.edu. It will eventually reside in atari/Sound/Players/play31.arc. This program is a command line and AUTO folder digitized sound player with lots of options.

New to 3.1 is the ability to play sounds from specific memory locations. This makes it easy for programmers to incorporate digitized sound playing into their own programs by calling QD Play with Pexec. This won't work, however, in an environment where programs aren't allowed to read their parents' address spaces. Perhaps this is the case for MultiTOS; I don't know.

Anyway, someone asked for this feature, so it's in there now. Have at it.

They are an idiot, who doesn't know how to use Malloc!

>(or could this be an indication that somewhere in my 4 Megs I
>have bad memory?) I know RR Tycoon requires this 1 Meg set-up,
>but I don't understand that one either. I'm slowly teaching
>myself 68000 assembler; is memory management tricky with the ST/STe?

Hardly, you tell the computer "i want x bytes", and it returns
a pointer to a block that big... its all very simple and straightforward.

I can't even think of a way to have it run only on a 1 Meg machine. its
a puzzle to me.

well... hmm, i guess they assume the screen will be in some certain
location, and it might not be there in higher memory configurations.
its only a guess, though, you'd have to *work* to make it only run on
a 1meg machine.

My current project runs fine on a 1 meg ST, a 4 meg STe, and a 4Meg TT.

Little John (haines@ccint1.rsre.mod.uk) wrote:
: I am not sure, but I *think* that V42bis uses compression to get 14.4 over 9.6 links.

No. V.32bis provides 14.4 data connections. V.32 provides 9.6. V.42bis does
provide commpression and error correction. With V.32bis and V.42bis and
a good telephone line you can expect speeds better than 14.4 kbps. You don't
get much improvement for compressed data but ascii file transfers will
usually go at 16+ kbps. Also be aware that V.32bis on V.32 can downgrade
the modem to modem communications speed after being connected if the line
quality is poor.

I don't know.
In the article of the so called 'st-magazin (8/93)' it was said that the board
and the processor runs at 50MHz clock, and there is a place (damned what
means 'sockel' in english) to put in a mc68040 not an expansion-card like
medusa.

>Something is wrong here - the best you can get is 1280x960 in mono and for
>that you can install 14megs of VRAM????
>Yuk...
>Jon
Sorry, but in the text it was said that the Video-Ram will took up to 14MB.

the whole machine is put into a pc-desktop-case (19") so there are
possibilities to use expansion-cards.

mike :-)

sheppard_r@kosmos.wcc.govt.nz writes:

>If FLASH/TRAPIDO can have a full screen so can Connect, so please give us what
>we wan't..??

IMHO full-screen-programs are simply not acceptable nowadays. The benefits of
GEM are: menubar, windows, loadable fonts, ..., ...
But a program that does - let us say - for instance BIOS-calls to do text
output seriously undermines multitasking (even on non-MultiTOS systems).

Something that made other plattforms such as the Mac so common, was the fact
that all programs are used equally and look similarly.
Consider the small monitor of a Classic. There is not significantly more room
than on a ST running ST-mid. Now ask a mac-user if he wanted to use a bare text
screen.

What i am trying to say is that you have to get used to the fact that modern
programms to output in a window and nowhere else (refering to screen-output of
caurse ;-))

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <87190@cup.portal.com>
Source record: 203039

The problem with programs that "need a 1 Meg ceiling" isn't that they need any particular amount of RAM to run in... the problem is sloppy programming that allows memory access above the "top of RAM".

If all you have in your machine is 1 Meg (or have used a program to fool the system into thinking you have 1 Meg), accessing slightly beyond the 1 Meg mark won't cause any problems..

Same if you have 2 Megs or 2.5 megs..

The problem occurs when you have a 4 Meg machine, and the program tries to access beyond the 4 Meg limit. The MMU chip generates a bus error and bombs...

(The maximum amount of memory the Atari MMU chip can access is 4 Megs.. at 4 Megs + 1 byte you get the bus error.)

One commonly used solution, other than a "MAKE1MEG.TOS" type of program is to install a small RAMdisk, just enough to lower the top of memory a safe amount below the 4 Meg limit. If the program accesses beyond the top of memory then, it will likely mess up the RAMdisk, but at least it won't bomb the computer.

BobR

Yeah, I've noticed this several times too. Is it just laziness from posters
who start a followup, decide not to post and just send off a blank article?
I don't find it very annoying, just bizzare. Especially when it's done by
those posters who feel the need to quote all the text from a long article
because they are too lazy to delete the excess.

No doubt site admins and gateway services take a dimmer view of this
traffic.

tcsh looks for an environment variable called HOME to determine the path
where it goes looking for startup files. This variable needs to be set
before tcsh is started. This is done most conveniently with one of the
zillions of utility programs for this purpose, as Timothy already
mentioned.

My thanks for all the responses I've received on this. I understand now,
and once again sure do appreciate the net. BobR's response above captures
very nicely the points behind the explanations I've received. Incidentally,
I've also received requests for the 1 Meg program. As soon as I verify
that it is public domain (I got it off an ST Format cover disk), and I'm
pretty sure that it is, then I'll try to figure out how to uue it, and
send it. This will be my first attempt at encoding and sending a program,
so please be patient.

2183. Mono emulators on STE

Newsgroup: comp.sys.atari.st
Date: 1993-08-05 15:16:45 UTC
From: spht124@liverpool.ac.uk
Message-ID: <CBAL3x.8Kt@liverpool.ac.uk>
Source record: 202961

I am thinking of changing my 1 meg STFM for a 2 or 4 meg STE but I am told that there are no mono emulators that work on the STE. As I rely on using one of these for many applications this would be a big problem. Does anybody know if this is true and if not which emulators work on the STE.

Thanks

G Wright spht124@liverpool.ac.uk

2184. For Sale: PC-Ditto (software)

Newsgroup: comp.sys.atari.st
Date: 1993-08-05 15:25:19 UTC
From: ggreenbe@mothra.syr.EDU
Message-ID: <1993Aug5.112520.7484@newstand.syr.edu>
Source record: 202922

I have what I think is the last version ever made of
PC-Ditto(I), the software msdos-emulator from Avant-Garde
Systems, that I would like to sell.
I have the original disk, the manual, the original package,
and even the little paper template that indicates some of the
keyboard mapping.
If you are interested, let me know how much you're willing to
pay for the entire package (including shipping).
Thanks,
Gerry
ggreenbe@rodan.acs.syr.edu
PS. For thos of you who do not know this product, it emulates
a PC at about half the speed of an XT (I believe) and can be
used with either color or monochrome STs. In other words, it
is a slooooowww emulation.

>
>609 /* Number of frames */
>Done!
>
>Real Time Spent (After Initializations): 26.989618 secs.
>Avg. Frames/Sec: 22.564232

Well, this probably isnt the best place to pose, but . . . (we are
talking mpegs)

The Sparc stations seem to be rather slow in general. At school, I
use an HP 9000/730, and it does about 38.00 frames a second (usually
faster than desired, so I generally rlogin onto our slowest 720 and get
about 22.0) HPs and the DEC Alphas are the fastest boxes I have seen in
common use. (The good rs/6000s arent bad).

My Sparcstation lags considerably, in both mpegs and all graphics
work.

I would imagine that a Falcon 030 could do at least 15 frames of mpeg
a second. (without using special software for the dsp). With the DSP,
maybe 20-22. Of course, I thought the DSP was specialized for sound in
the Falcon, and is not used for video at all. But if it can be used for
video, it should deffinately help.

> f:\bin and double click on tcsh.ttp, it starts up fine, cheerfully ignoring
> all the potential startup files I've left around for it. What should I do
> to change that behavior? [...]

You should put the startup files to a place where `tcsh' looks for them. :-)

From the `tcsh' man page:

30. INPUT FILES
On startup tcsh will try to source /etc/csh.cshrc and then
/etc/csh.login if the shell is a login shell. Then it will try to source
$HOME/.tcshrc and then $HOME/.cshrc if $HOME/.tcshrc is not found. Then
it will source $HOME/.login if the shell is a login shell. On exit tcsh
will source first /etc/csh.logout and then $HOME/.logout if the shell
was a login shell.

Note:

o The HOME environment variable must exist in order to have any startup
files below $HOME sourced.

o If you use the `tcsh' binary for MiNT as distributed, the initialization
files have different names as indicated in README.ST:

UNIX file name DOS file name

.history history.csh
.cshdirs cshdirs.csh
.tcshrc tcshrc.csh
.cshrc cshrc.csh
.login login.csh
.logout logout.csh
/etc/csh.cshrc /etc/cshrc.csh
/etc/csh.login /etc/login.csh
/etc/csh.logout /etc/logout.csh

o The files from /etc are taken from the device that is your default
root device under MiNT; that is, the argument to the UNIXMODE
"r" switch, or drive U: by default.

>with. What they REALLY need is the PowerPC to gain some measure of success
>and threaten their high end sales (where Intel traditionally makes most of
>their money) and goad them into real competition.
>

Did you see the CeBIT report in July's ST Informer? Digital Equipment
(DEC) had set up a booth showing their Alpha PC in competition with a
Mac Quadra and a '486 @ 66 MHz MS-DOS machine. They were running a
benchmarking program using the calculation and display of a 256-color
mandelbrot set for comparison purposes. The results:

Mac Quadra 12 Seconds
'486 @ 66 MHz 6 Seconds
DEC Alpha 5 Seconds

Sixty feet away from the demo, Atari demonstrated the same benchmark
in true color mode:

Atari Falcon 4 Seconds

Needless to say, DEC was rather ... um ... irritated that a low-cost
home computer could show them up in this manner!

Maybe the best way to light a fire under the Intel designers would be
to supply them with a Fleet of Falcons, eh?

Having bought and used PC-DITTO, I would have to agree that it
it slow. But I think your are exaggerating the speed to say it's
half as fast as an XT. Maybe one-fourth (on a good day, and
providing there is no sound)

>Hi!
>What is the 3DO-machine from Panasonic. Is it comparable to the jag?
>Where are the market places for 3do?
>
>mike :-)
>

Ok, the specs for 3DO off the top of my head are something like this (please, don't take this as the gospel, because i may be mistaken):

- built-in 5 1/4" CD unit (for music CDs, CD-I, 3DO software, etc...)
- 2MB of memory (i think Sega Genesis and SNES have 64k... Jag has 2MB as well)
- 12.5 mhz ARM 32-bit processor
- video is 640x480 with 24 bits of color

Like Jag it can do real-time texture mapping and manipulation of 3D objects. It also has a video-in (SVHS) and video-out (SVHS) so it may be able to look a lot better than Jag on a good TV set (unless Atari also has SVHS out c capability).

Babbage's says they will be carrying them and prominently placing them near the front of the store (so it looks like someone believes in 3DO).

Another thing I've been told that I'm not so clear on is that 3DO is not a system, per se, but a STANDARD. Conceivably, it would be possible for existing game companies to make machines that adhere to a 3DO standard, although my guess is that if this is the case, they'll need to still use essentially the same hardware (although it would be nice for Atari to offer a CD Unit for the Jag that turns it into a 3DO, effectively making it THE ONLY MACHINE TO BUY).

Jaguar appears to have some significant advantages, not the least of which is the fact that it has a 64-bit RISC CPU and 64-bit buss, so it seems more powerful in that respect than the 3DO.

It emulates at about 1MHz, so that is ~1/4 of an original 4.77MHz XT.
However, the compatibility is very good. Speed seems to be the only
detriment to this product. It is quite handy if you have to occasionally
run some relatively lightweight DOS applications.

From: dud@stein.u.washington.edu
Message-ID: <23ro4h$aak@news.u.washington.edu>
Source record: 202972

Anyone have a spare AJAX ship floating around? Or know where I can get one? When I got my TOS 3.06 and HD floppy upgrade, I put the chip in backwards (I know, incompetence reigns...) and fried it. My HD floppy drive is very unreliable with the old controller. Most recently, it quit writing to disks! I've tried replacing the mechanism several times, and the ones I've taken out work fine on a 486 I have here. I've tried putting other non-Ajax controller chips in, and that doesn't seem to help either. So I've come to the conclusion that I need an Ajax chip, but I can't seem to find one anywhere. I tried my local Atari dealer, I tried Best electronics, etc... Any help is much appreciated!!!

Thanks,

Dan Aylward

If you do everything everyone else has said, and it still doesn't work,
this may help:

TCSH is not a "login shell" by default. You can change this by simply
starting it with the -l paramter. If you run it in TOSwin, a similar
thing can be accomplished by turning off the "ARGV"; for some reason that
makes it think it's a login shell. It has to be a login shell to read the
TCSH.RC file.

Hope this helps...

2198. Atari 1040ST for sale

Newsgroup: comp.sys.atari.st
Date: 1993-08-05 20:11:25 UTC
From: dwyer@cs.umass.edu
Message-ID: <23rphdINNip@ymir.cs.umass.edu>
Source record: 202968
Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other

The following hardware and software is in good working condition. It
was taken off line (and boxed up) last week.

Hardware:
1040STf (1M ram, 1 disk drive)
SM124 Monochrome Display
Supra 2400 baud modem
Panasonic 1080 dot-matrix printer

Software:
Atari Logo (programming language bundled with machine)
A prolog environment (can't remember the name)
DEGAS (a paint program)
1st Word (word-processor bundled with machine)
Megaroids (asteroids like game bundled with machine)

Some freeware/shareware stuff:
Shareware C compiler
ICON (programming language)
XLISP
uniterm (communications)
uemacs (editor)
nethack (ascii game)
misc. utilities

I am asking for the following prices:

1040STf + SM1240 + Software + Docs : $225
Supra 2400 baud modem : $35
Panasonic 1080 dot-matrix printer : $75

or

1040STf + SM1240 + Software + Docs + modem + printer : $300

the separate C and C++ compilers have disappeared when changing from
GCC 1.x to GCC 2.x
in the gcc doc, it says that running g++ is exactly like gcc except
for a few very little tiny detail. gcc compiles c++ files just fine !
(I guess the main difference is that g++ assumes every file is in c++
whereas gcc assumes a .c file is in C)
And yes, gcc also compiles ObjC. But I have no idea where the libs are

just ftp'd a neat little Freeware editor/word processer called SpiritED.
it works as a desktop ACC, and is pretty smooth being mostly compatable with
the atari clipboard CPX (it saves its clips as .ASC which is incompatable
with Connect, my term package of choice, which saves its clips as .TXT).
reguardless of that, I am now using a Multisync monitor and all of a sudden
I have a need for fonts! This nice editor has a rather large font so It
is difficult to see 80 columns width on my screen. Is there a nice program
out there I can get that will make this happen? It was recommended to me
that I get Warp9 or NVDI, but I am perfectly content with my TurboST that
I have had for a few years now. Is there something in the pd or shareware
domain that I can use? Would gdos work (I have no idea what gdos is good
for, other than things with assign.sys files)? I just want to replace the
normal screen font with something a little smaller.
Thanks!

I guess "video RAM" means "RAM that can be used for display by the video
hardware" in this context -- usually, this is called "ST-RAM", and
"Fast-RAM" is often referred to as "TT-RAM". Since ST-RAM has 24 bit
addresses, so the upper bound for ST-RAM is 16 MB. However, it is 14 MB
only because some of the 24 bit address space is used for ROM and
hardware registers.

>
>My point exactly..... 8-) (Sorry!)

Hi Steve,

I'm in the same situation you are. I'm using a color monitor, so
Connect and Stalker don't suit my needs. So rather than berate you
for not having a Falcon or a mono monitor, I'll just suggest that you
use Freeze Dried Terminal.

There ARE some things about FDT that I don't like. For instance, the
emulation (ansi) is not very good. For some reason I cannot get it to
give me inverse text if I switch back and forth between menu/online.
For that reason I call up Uniterm when I'm reading text and need inverse.
It's a pain, but it works. This problem makes it very difficult to
use FDT with certain newsreaders.

Also, the text editor leaves a lot to be desired. I suggest you call up
a real word-processor for this too.

Of course, these solutions only work if you have plenty of memory. I
guess that's life though. I'm eagerly awating the new release of FDT
to see if these complaints are fixed. If there were not, I was just
going to buy Flast II. But since I can see by your posts that it's not
very good, I guess I'm out of luck.

Anyway, I hope this helps. Freeze Dried Terminal should be available
at any major FTP site. I can say that the author did a good job on
the program. There are some nice features, like autolearn auto-logon,
auto-Zmodem, etc. But there are bound to be things you won't like about
it. As far as terminal programs go, I consider it the best option if
you're using an ST or STe and don't have a monochrome monitor.

2215. Re: Starting tcsh under MultiTOS??

Newsgroup: comp.sys.atari.st
Date: 1993-08-06 04:15:36 UTC
From: saj@chinet.chinet.com
Message-ID: <CBBL61.LEM@chinet.chinet.com>
Source record: 202852

With a lot of help (thanks, people) and a little thought, I got tcsh (latest version) to start up properly under MultiTOS on a stock Falcon. This might be FAQ material, possibly.

The key to the exercise is putting the line
setenv HOME=f:\bin (an extra trailing '\' did neither harm nor good)
in C:\multitos\mint.cnf. After doing this, it's necessary to reset the variable $HOME, because otherwise somehow tcsh uses a path with a trailing equals sign as $HOME. Anyway: with that line in mint.cnf, starting tcsh.ttp from the desktop causes f:\etc\cshrc.csh to be sourced. The problem of the trailing '=' is solved by including the line
setenv HOME="/dev/f/bin"
or some such in the file. After sourcing f:\etc\cshrc.csh, tcsh.ttp sources f:\bin\tcshrc.csh (presumably $HOME/tcshrc.csh). All that is with no command line arguments to tcsh. If a command line of -l is passed, the files sourced (in order) are
f:\etc\cshrc.csh
f:\etc\login.csh
f:\bin\tcshrc.csh
f:\bin\login.csh

It's good to have a large 'mix-n-match' collection of utilities when working with tcsh under MiNT. A lot of them crash.

Steve

2216. faxsoftware

Newsgroup: comp.sys.atari.st
Date: 1993-08-06 04:29:22 UTC
From: gfrajkor@superior.carleton.ca
Message-ID: <CBBLsz.1rK@cunews.carleton.ca>
Source record: 202988

I have bought a USRobotics 14.4 FaxModem which promises high speed faxing as well as the usual modem functions. Well, the high speed modeming works fine,but Straght Fax, which I am told is the only fax software available for Ataris, does not recognize the faxmodem. Apparently straightFax works only with Class 2 modems (rockwell chip set stuff) and is not sophisticated enough to deal with Class 1. So here I am with a hotshot faxModem and no working software. No wonder people buy macs and messydosses.
What's my choice?? Is there fax software available for the Atari that works with USR and other Class 1 stuff?

My machine is a MegaST, four meg. No problems with it otherwise.

2217. MUSIC SEQ/NOTATION SOFTWARE

Newsgroup: comp.sys.atari.st
Date: 1993-08-06 04:34:07 UTC
From: hicksm@hindmost.lpl.arizona.edu
Message-ID: <23smvv$rlr@organpipe.uug.arizona.edu>
Source record: 202996

Hello helpful Atari people! I am going to be receiving a used 520st, expanded to 2.5 meg with hard drive type computer soon and I want to get it working on midi sequencing and music notation and so I am calling on you for suggestions, experiences with various software packages and where to buy them cheaply.

My needs

-MIDI SEQUENCING: I am currently using a commodore 64 and Dr T's KCS and find it quite adaptable etc, etc, but the graphical interface is hard to deal with. What are your suggestions?

-MUSIC NOTATION: I would like to use my synths as a tool for working compositions for traditional instruments and therefore would like to be able to easily generate scores. Ideally, the package would in addition to normal 9-pin printers, would be able to output postscript file output so I could send them to the laser printers at school. Something like the performer/finale combo on macs.

-PRICE, EASE OF USE: Yeah, like most everyone I would like to find something that does what I need, with the minimum of pain, at an inexpensive price. Shareware pointers would be appreciated. Does any one have software they wish to sell me? What are good inexpensive software houses? Do educational discounts exist?

-COMPATIBILITY: The computer I will be getting is an expanded 520ST. Do I have to worry about packages written expressly for the 1040 not working on my machine to be. Is the TOS version important?

Thanks for helping me out. I need your expertise.

-Michael

The only editor I know that allows this is Everest. It is VERY good but is
not an acc. No program can globally replace the system font with a smaller
one.

>D>picture o the desktop, the mouse accelerator,
> ^^^^^^^^^^^
>This is a feature of NVDI too ...

Speaking of NVDI/Warp9.... I have Warp9 3.70 (upgraded to 3.75 (I
think that is the right version #) via the upgrades on a.a.), but the
problems I see with getting it (after the fact) are:

a) It won't work with MTOS - MTOS dies on load, I think because of the speed
loading of warp9 I think. Putting MTOS files in the warp9.dat file didn't
help.

b) The only picture formats supported for the background either are only for
ST resolutions, or it can use the .PNT format - but I don't have any way of
converting my graphics (a lot of Star Wars, space, landscapes,etc.) that are
in .gif and .jpg format into .PNT. Does anyone have a .PNT format
description they could send to Dieter Fieblekorn (sorry for the
misspellings) of GEMview fame? Will .PNT files support my nice 800x600x256
screen? One feature that might have made Warp9s background pic feature
bearable is if they had allowed a "tiling" feature, such as offered by
Windoze. Then I could tile my neat picture of a neon splashed skate-boarder
all over the place.

c) Does it support graphics cards? (I don't know, but I just got the NOVA
graphics cards which installs its own VDI as I understand it).

As far as I know, NVDI does support a) and c), but it doesn't have a
backround feature.

When all I had was a 520st, Warp9 was a God-send - I especially
liked the fonts that came with it. But now with a graphics card, MTOS, etc.
it becomes mostly useless and spends its time in my autofolder as warp9.prx.

>Bye
> Stefan
>
>_____________________
>Stefan_Damerau@sl.maus.de

Now that that is all said and done, can someone tell me where I can
get:

1) A background program that will work in arbitrary resolutions/colours in MTOS and new machines, and support at least .GIF, if not .TIFF or .pic (mac) or .jpg or .bmp (blech!)?

2) A company that sells the latest version of NVDI, that is in the US, if NVDI works ok with the NOVA card?

Thanks Mucho!

H
The diskette supplied with the January 1990 issue of the American START magazine (vol 4 no 6) contained such a converter by a Dave Edwards. I do not have my diskette to hand at the momemt, but according to the article in the mag, source code in BASIC was supplied, and it was compilable by most Basics, including QuickBasic on the PC.

If I remember correctly, all START stuff was copyright, not PD, and am therefore doubtful if this may be uploaded, even though START is now defunct. Comments?

The other point about the 3DO is that it is supported by a consortium of prominent hardware and software companies (including Atari's own Time-Warner) and there are a large number of systems already in developers' hands.

The Jaguar has an advantage over the 3DO in that its hardware is arguably better, and its price *may* be lower ($200 base unit, plus $200 for the CD).

The 3DO had an announced price of $700 including the CD drive, but recent reports indicate it will debut with a considerably lower price (closer to the Jaguar total).

Looks like interesting times ahead...

>I can't verify it, but I have heard rumours to the same effect.

I spoke with my dealer yesterday and he could confirm the specs, but said
that the fax he got from GE-Soft was intended as survey among dealers if
they would want to carry such a product or not. It is, in his opinion, not a
real produt yet and might not be either.

BTW, the only thing he hadn't heard of were the dual VME buses. His spec
sheet did in fact not include VME at all (which sounded strange to both of
us). The 040 and DSP chips are not delivered, just supported by a socket for
each.

To add to this, 3DO claims they will have 100+ titles ready for the machine
by the end of the year. The Jaguar doesn't seem to have that much going
for it at this moment....

>The Jaguar has an advantage over the 3DO in that its hardware is arguably
>better, and its price *may* be lower ($200 base unit, plus $200 for the CD).
>

Well, the thing about Jag is that the CD unit is optional, and until it is
demonstrated, I think it is more vapor than the Jag itself. (which has not
materialized for sale, and won't 'til Hallowe'en)

The $200 price point makes it very attractive... because the 3DO is more
than a game machine, and it costs a heck of a lot more, it may become a
much more difficult sell to the masses for just games, as 3DO is expecting
that initial batch to be sold as game machines....

(after all, if Jag can do it all cart-based for $200.. why spend $500 for
a 3DO?)

The big advantage of 3DO is software... and price... I've heard that
John Madden '94 for 3DO will retail for $29.95 on CD. Carts are expensive.

>The 3DO had an announced price of $700 including the CD drive, but recent
>reports indicate it will debut with a considerably lower price (closer to
>the Jaguar total).
>

Well, the cheapest we'll see a 3DO from what I've heard is the Sanyo unit
that has an MSRP of $550 but won't ship until after the $700 Panasonic one.
I wouldn't expect a lot of discounting on the system for a little while,
maybe near Xmas, as they begin to worry more about selling units....

The host adapter and the 4070 reside on the same board and the
interface is not easy to find and use.

> (or the OMTI version which was better (1:1
> interleave instead of like 1:2))

The Adaptec controllers all use 1:1 interleaving.

> If so, then you could use a SCSI drive,
> which are still made, more readily available, cheaper (unless you find
> someone dumping an old drive), and faster.

That's the theory, but if you really want a SCSI drive in a
Megafile, it would probably be much easier to remove the
old board and insert an ACSI/SCSI host adapter.

> G Wright spht124@liverpool.ac.uk
>

At Atari.archive.umich.edu ftp site you'll find the little program called
double... It doubles the size of the screen in height
- either using scrolling... (when the mouse gets close to the border)
- either using pseudo interlace (flicker) to actually double the screen
size.

320*200 -> 320*400
640*200 -> 640*400
640*400 -> 640*800

And when in Mid-resolution, you still keep colors with 640*400 mode...

It works ONLY ON STEs !!!
It worked great on my MegaSTE, both with scrolling and flipping mode, and you
can gonfigure your display (Display rate, desktop colors & fill-shapes) in
order to reduce flickering...

One only problem : when used with Mid-Res, for example, this program doesn't
"tell the system" that it is in High Res: it doesn't use 16*8fonts, the font
is still the same, just twice less high... And some programs recognizes it
as Mid-res mode (like calamus) and won't work...
Other programs that work (Calamus SL) will not consider the new aspect ratio,
(good when used with scroll-mode, but not when using flipping)...

If the author of this programm read me (I haven't it's coordinates here):
Your program is really good, it would be wonderful if you added the possibility
to configure the system to really emulate High Res mode, like Sebra or others
does, leaving the possibility to use it simply as a screen size enhancer (what
it is now).

Now a question:
why doesn't exist a sort of BigScreen (you all know bigscreen) that display the
ehnanced screen using overscan techniques used in demos, or some drawing
programs, on a stock ST(e) ? (e.g 800*250 in 4 colors without flipping,

without scrolling would be so great !)

Is there a technical dificulty (such as mouse interrupts interfering, whatever)
that cannot be by-passed ? I'm not familiar with overscan routines...

>
> Can some-one supply me with the MONITOR pinout for an ATARI 1040STF?
>I lost my handbook.

(stuff del)

Pins Function
1 Audio Out
2 Reserved (not connected on early STs,
Comp. vid on modulator machine,
comp. sync on Mega)
3 General Purpose Output (TTL +5V I believe)
4 Monochrome detect (puts ST in mono mode)
5 Audio in (gets mixed with internal sounds)
6 Green
7 Red
8 Ground
9 Horizontal sync
10 Blue
11 Monochrome (out to SM124 etc)
12 Vertical sync
13 Ground

One of the grounds is "blue ground" - 13 I think, but that is not in the handbooks.

|>
|> Herb

It isn't true, that the German magazine ST-MAGAZIN merged with
any other magazine etc. TOS or ST-COMPUTER !!!!

True is, that TOS and ST-COMPUTER merged.

When that happened, the TOS magazine send letters to several advertisers and
stated this rumour, to get the advertizers from the ST-MAGAZIN.
Now a court have to deal with this.

Here in Germany are two individual ST magazines and this will last
for a long time, as the Editor of the ST-MAGAZIN told me !!!

RE: TT-clone

Only the 68040 is doubling its internal clock not the 68030.
The Medusa-Board is shipped with a 68040-33 (clocked internally 66 MHz)
and 8MB-FastRAM and Towercase (to put a MegaST-motherboard in) and ...
for 3050 DM +tax! but I don't know if this price won't rise after the
RAM-crisis in Japan.

The Eagle has an 68030-50 (optional 68040-?), 50 MHz-Bus and ....
The price hasn't been mentioned jet, but IMHO will be much higher than a
original TT.

> but the Internet address given in the readme file bounced. Anyone know
> his current internet email address?

Since he graduated from MRIH in June this year, his email account on
samson.mrih.no was deleted. whenever I get the chance to get unix1
back online again, however, his address will be karloey@unix1.mrih.no. This
will happen sometime end of August/Beginning of September. Till then, try
phoning him on +47 70 40015 (After a certain daite, when the Norwegian telecom
has expanded the net in this area, this
phone number will be +47 700 40015. Or reach him by snailmail on the following
address:
Karl Anders Oeygard
PO Box 8
6180 Saeboe
Norway

When it comes to the PD version of ProTracker, last time I spoke to him, he
said he would let me upload some stuff
for him to certain sites, but he wanted to make a Falcon compatible version
first.

And the reason why this article looks so ugly is that I am writing this with a modem and
get double echos because of the settings on the host at MRIH.

> Thanks in advance,
> Victor Bruhn
> vicb@clark.edu

No problem! Karl Anders is a good friend of mine.

>in C:\multitos\mint.cnf. After doing this, it's necessary to reset the
>variable $HOME, because otherwise somehow tcsh uses a path with a trailing
>equals sign as $HOME.

I can't remember what the syntax for the mint.cnf file is, but if you
put "setenv HOME=f:\bin" in a shell script you would be wrong - the
reason this gives the trailing '=' is because you are setting the
environment variable "HOME=f:\bin" equal to blank, not setting "HOME"
equal to "f:\bin". The correct syntax would be to use a space instead
of the equals sign:

"setenv HOME f:\bin"
^

This should work perfectly.

2237. Call for harddisk help

Newsgroup: comp.sys.atari.st
Date: 1993-08-06 11:24:16 UTC
From: plewe@dl.mpi-dortmund.mpg.de
Message-ID: <2F3FBZ2L@gwdu03.gwdg.de>
Source record: 202857

I have two problems concerning hard disks in my Atari TT:

- I have a new Conner CD30170E and it does not work. There are some
principal problems with this disk concerning a parity check,
which the Atari controller does not support, but the parity check
has been disabled by Conner, meanwhile.
A boot-time, my TT recognizes the disk correctly as a Conner-disk
of this type but later refuses to format it.
There is access for a few seconds but then HDX returns with the
standard error dialog (... check connections ...)
I am using a TT from late '91 with TOS3.01 and HDX5.

- What is the actual version of HDX?
Where can I get it?
Or is there a better driver?

Any hint is welcomed!

- Joerg Plewe, MPI-Dortmund, Germany

2238. my experiences with STf memory upgrades...

Newsgroup: comp.sys.atari.st
Date: 1993-08-06 11:43:21 UTC
From: lancer@rajeesh.WPI.EDU
Message-ID: <LANCER.93Aug6114321@rajeesh.WPI.EDU>
Source record: 202761

I posted a while ago about upgrading the memory in my 1040 STf, and since then I've learned quite a bit about it. Since there is no entry about this in the FAQ, I thought I'd share what I've learned with the group...

Here's the whole story:

There are MANY different ST boards. ESPECIALLY 520s! This is why there are so many conflicting directions about upgrading being thrown around the net.

Some have 16 (or 32 for a 1040) DRAM chips under the keyboard. On 520s of this type, there are 16 free spots on the motherboard which you can fill with either 32k DRAM chips (and get one meg) or 64k DRAMS (and add a line from pin 64 of the MMU so it can address the > 1024k or memory and get a 1.5meg ST). Or you can replace ALL the chips with 64k chips, add a line from the MMU and have a 2 meg ST... This could presumably be done with 128k chips and get the full 4 megs, too...

Some others have 4 (for 520s) or 8 (for 1040s) RAM chips under the power supply or on a daughter board. On these you need to either add 4 more 128k DRAMS (on a 520 to get 1 meg), or replace all of them with 256k (or even 512k) DRAMS and add the MMU line and get 2 or 4 megs.

OR you can add a SIMM board! This can be done by hand (difficult... You have to remove your chips, get a daughterboard and some SIMM edge connectors, wire everything together) or by ordering a kit from a place like Toad (for $79 not including SIMMs) and do it without soldering.

If you want to do things by hand, and have one of the STs with the memory in 32k DRAMS under the motherboard, get the text file, "2_5ram.zoo" in the Misc directory on atari.archive.umich.edu. Though it doesn't have any pictures (which would have been helpful), it will guide you through the process pretty well... I warn you, though, it's NOT easy unless you're pretty good with a soldering iron!

For my 1040STf (a Rev C board with the 32 chips) I opted to buy the SIMM board (because I got some free 1 meg SIMMs!) instead of having to desolder (no lie here) 512 spots and solder another 100 or so without error! I'm a bit shaky with the iron, see, and I really didn't want to waste my whole ST...

If you opt for the kit upgrade, I highly reccommend buying the unpopulated "Xtra RAM board" from Toad (they're a great company) and getting SIMMs off the net... You can use either the Mac-style 1x8 SIMMs or the PC-style 1x9 SIMMs... In fact, I may have some extra

SIMMs lying around...

That's it! Please, if there are any errors here or if you can add
some more, post away! But don't flame! I'm just telling you all what
I've found in my quest to upgrade my ST!

I think that software that only Supports the NONE STANDARD Class 2 should never been sold, the word here in N.Z. is to go only for Class 1, as that is a REAL STANDARD...

There are 2 other FAX Programs that I know of, the USA one Jopa Fax, now under another name and the German ST-Fax...

There is also the FREE GNU Fax stuff that I have not seen any reference to in this Group...

I have a Demo version of ST-FAX 2.5 but it only supports Sierra Commands...

Does any one know were I can get a list of Sierra Fax commands, I would like to try and Patch ST-FAX so that it will work with my Supra modem...

No, it isn't.

The ST-Magazin merged with the ST-Computer.
The ST-Magazin-staff is now working on a new project called "NT-Magazin".

Actually the DSP can be used for anything you would like. At CEBit Atari should a Falcon running mpegs at 15-20fps, supposedly using the 56001 to

perform the decompression. I do not know if these mpegs included sound.

The DSP is limited only by the program and available memory, and the imagination of the person writing the program :)

In case you didn't yet know:

"The most progressive Atari developers have combined to launch:-

Le'ST Get Serious Show!

If you are serious about your Atari then this is the show for you..."

...or so it says in the advert in September's Atari ST User.

Loadsa stuff promised from the likes of:
Atari (UK), Atari Workshop, CGS ComputerBild, Club CuBase, COMPO, Digital Arts, Gribif, Harman Audio, Hisoft, UK Midi Association, and many more too numerous to type.

Shows are planned for London, Manchester and Birmingham.

London show:

Novotel Hammersmith
Salon Bourg Suite

Saturday August 14th, 10am - 6pm
3.00 UKpounds (1.50 after 2pm)

Organisers:
Ray Cross (081 686 8128)
David Encil (021 414 1630)
Neal O'nions (0480 891819)

See ya there.

a.a.u.e (well actually all of archive.umich.edu) does have a pretty strict limit. They allow only 10 ftpers during the day, which goes to 20 after about 5 and 30 after 11pm. 60 on weekends. Even so, this is VERY limited.

wuarchive.wustl.edu allows * 250 * users to ftp in. Admittedly they are probably a larger archive area as they have more disk space. They do have everything on a.r.u.e (one day delay usually). So that is a better place to ftp to. (umich is faster, but the chances of getting on are fairly bad).

a.a.u.e does have AFS though. So if anyone actaully has AFS they can set up a link to the archives and access the files with normal unix operations (i.e. cp)

I just talked to Toad, and they claim that Straight Fax will support Class 1
by Sept/Oct 93. The price will go up at that time (it is ~$69 now), but
you will be able to upgrade current version of Straight Fax for "some
reasonable fee". Their phone number is (410) 544-6943 (or 1-800-448-TOAD).
They also say that a brochure is available that explains Straight Fax in
detail. I suggest that you call them and get the straight facts, har har.

2253. Dungeon Master on Falcon?!

Newsgroup: comp.sys.atari.st
Date: 1993-08-06 16:08:54 UTC
From: ac382@Freenet.carleton.ca
Message-ID: <CBCI6u.8Lv@freenet.carleton.ca>
Source record: 202866

Has anyone been able to get dungeon master (or chaos) to work an a Falcon?
I get as far as the gate and load save game menu but after the game starts
loading the drive keeps spinning without anything loading. I've heard that
it works on a TT so it should work on a Falcon.

2254. disk speeds and ratehd

Newsgroup: comp.sys.atari.st
Date: 1993-08-06 16:32:12 UTC
From: llunch@tarjan.cba.csuohio.edu
Message-ID: <1993Aug6.163212.6086@news.csuohio.edu>
Source record: 202868

For about a year I have had a quantum LP40S that I was able to
get very cheap. For awhile I have been considering getting an ELS85,
but decided to get a different quantum drive I also got a very good
price on. I just got this drive and am having trouble figuring out
how it performs. ratehd.prg gives (aproximately) the following results:

drive: Transfer rate: seek time:
LP40S 740 K/s 30ms
new drive 540 K/s 25ms

I thought I read of people getting much better results with quantum
drives and ratehd before. Do the above numbers seem odd to anyone?
I have a 520st (external floppy, tv output but it doesn't say stm on
the case). Is it possible that people who get better numbers from
ratehd have a newer version of the dma chip and I could have my
computer upgraded? Does anyone have an st and an els85 that performs
better than the above drives? (I'm trying to decide wether I should
try to take this new drive back).
I unpacked a large zoo file (gdb36p2s) on clean partitions of both
drives and found that the new drive did this 7 seconds faster (4:23 vs
4:30). So the slower drive actually allows tos to work faster, but
the difference is insignificant? Or is ratehd returning invalid info?

Thanks in advance for any thoughts facts rants and advice,

Try to rename the file NEWDESK.INF to something else and re-boot. If that
solved the problem then get rid of it. Another possibility is that the first
acc has the fast load bit set. The best solution is Pinhead, which you
should copy to your Auto folder. V2.1 is the latest.

That's correct; I should have been telling this in the docs (and I will do so in the next release).

BTW: `tcsh' will also behave as a login shell if it has been started with the string "-tcsh" in argv[0]. The "-" the way the `login' program communicates the desired behavior to the shell.

> It has to be a login shell to read the
> TCSH.RC file.

That's wrong: The tcshrc.csh file (resp. tcsh.rc in older distributions) will always be sourced. Files that will only be sourced by a login shell are: login.csh, logout.csh, /etc/login.csh, /etc/logout.csh.

Apart from the incorrect syntax another poster cared about already (the "="
should be a " " (space)), I'd like to note that the /bin directory
is not a sensible choice for a home directory. The home directory should
be a directory which keeps a user's own files. Many programs look
for their initialization files in $HOME, and you probably don't want
those initialization files to reside in /bin.

> '-w0', if
> you don't want LHarc to use $TMPDIR or $TMP.

v2.22 already! I've only just got v2.21 ;-)

By the way, the version of Lharc i've got has got German docs, is
there any FULL English docs available?

One thing i've noticed when using ACS & BinkleyTerm is that
a couple of times it says something like 'Garbage found - File
skipped'
why? Is there a way of telling Lharc NOT to skip the file?

Cheers,

Didn't seem like an implication to me, more like a direct caution!
Besides, I've used Macs over the years, and some Mac distribution discs
were virus infected, as well. It seems that no matter how safe you
are in the disc duplication process, the odds are that a virus is
going to slip by sooner or later.

Actually, I use STalker all the time on color monitor, without GDOS fonts, and without resorting to the 8x8 system font. Since you can turn off the title and scroll bars on STalker's window, you can get an 80x23 screen. Admittedly this isn't the standard 80x24, but most of the time it's close enough. You can still resize the window, and you can still scroll the window's contents. (The former by using the mouse, and the latter with the keyboard.) And, of course, if you really feel you need a bigger screen, you could use GDOS fonts or the smaller point size.

I certainly have to agree with the comments of some of the others that the advent of Geneva, MultiTOS, etc. makes running in a GEM window a much more important feature.

There are two devices, MODEMMIDI and 16PLUS, which do the trick, both are
compatible with Cuabse but neither work on the Falcon. In the UK try UKMA
+44 81 368 2245, in US try TranTrax (don't know their phone number).

So just disable the menubar and extend the window such that the interior dimensions are the size of the full screen. The only thing it would require is a hot key (or right mouse button press?) to shrink the window and re-enable the menubar when it needs to be accessed.

>use FDT with certain newsreaders.

I think the problem is that FDT uses IBM-ANSI, which is not the same
as VT100, which in turn is what UniTerm uses. I have never seen a
Unix-site that supports ANSI. I think it is quite common to think that
VT100=ANSI, but that is not the case. My personal experiences with
FDT's ANSI-emulation are very good, it has the fastest emulation I
have ever seen on any terminal program.

>Also, the text editor leaves a lot to be desired. I suggest you call up
>a real word-processor for this too.

That's true, but then again FDT is a terminal program, not a
word-processor. The export function of the scrollback buffer that
exports text to the editor is so slow, that it takes seconds to export
just 20 lines to the editor.

The material used in the case is a styrenic with molded-in color. Sty-
renics are notoriously sensitive to UV radiation (such as in sunlight
and some fluorescent lamps), and will yellow badly under the proper con-
ditions. It is primarily a surface phenomenon and will have minimal
effect upon material properties unless carried to extreme. I have an
ST bought second hand that is badly yellowed, and I suspect that it
spent much of its life near a window.

2268. looking for Eidolon source or programmer

Newsgroup: comp.sys.atari.st
Date: 1993-08-06 22:38:09 UTC
From: asmodeus@telerama.pgh.pa.us
Message-ID: <23umgh$7ap@telerama.pgh.pa.us>
Source record: 202882

I have been running a bbs for several years now, and I came across this great game for the ST called Eidolon. It is very much like a dikumud for the st, and can be run as a bbs game. I have it set up to be used with BBS Express! ST, and I believe that it was written originally for innersanctum bbs.

I have sent mail, via usnail, called many bbs's and even downloaded a bunch of other files about innersanctum from Genie trying to get ahold of the original programers. No go. My mail was returned unopened, no forwarding address. My inquiries on GEnie went no where, and the docs in innersanctum bbs were little help.

What I am looking for is the source code for this game so that I can fix some of the bugs in it, and try to get it running again with more commands. I would like to take over the st support of this, but I can not find the source, the programmer, nadda.

I have heard that it was also called 'Other Worlds' and was available on the ibm platform.

If anyone has any information about these games or the programmers, please let me know.

Thanks in advance.

All versions since 2.42 have supported high density floppies, FLopticals have been supported since V2.50, The latest version is V2.51. Diamond Back 3 is expected to be released in the next two months and will support multiple volume removable media including SCSI tape drives.

In The Chambers of the Guardian, in Dungeon Master, there are blue buttons on the walls next to the grates sealing off the small rooms. Try pushing the buttons...

Also, there is something in one of the rooms.. see what happens when you push the button next to that room. Go find it again, and try it again.. Keep on trying until something different happens.

You'll then find something you can show to the "eye" on the wall...

At one point before I got my hard drives, I had three different viruses
taking turns being active on my system... I think it took me a month or
so to notice.

I've NEVER EVER heard of the 'Key'/'Signum' virus actually doing
anything other than infecting disks. I asked on GEnie about this virus,
and nobody there had ever heard of it going off either.

It may be incredibly wide-spread, but it doesn't seem to _do_ anything.

Yes, but will it require 100% of the CPU's time? Will it work with
MiNT? I know if I had a faster machine (TT or a future Falcon) MiNT and
probably MultiTOS would be running all the time.

Source record: 202903

Greetings again. Sorry I took so long to make this summary, but
I had some problems with transfering things from the work computer
to my ST (no working transfer protocols, except a kermit with problems)

Anyway, in response to my initial querry I got a lot of email. There were
3 categories:
1. people telling me to post this msg
2. people mentioning japworpr.arc on atari.archive.umich.edu
This seems to work but does not have printing capabilities. It is,
however, enough for my brother's needs for now, so I did not obtain
#3.
3. people mentioning SIGNUM. If I understand correctly, it is a word
processor capable of doing many different languages, and there are
japanese fonts out there for it.

Thanks to everyone who contributed. As I said before, I don't have time
to keep up on this newsgroup, so if anyone has a followup they want me
to read, email it to:

From: jmillar@news.delphi.com
Message-ID: <241gbv$t2q@news.delphi.com>
Source record: 202907

I was wondering if there was a person here that was knowledgable about MultiTOS and MiNT that could tell me how, specifically, to set up a working and compatible tcsh with a /bin full of UNIX-like commands.

I have the Atari conversion of tcsh as well as a few .ttp's and .prg's that emulate the equivalent UNIX commands rather well. I simply need to know where to put all of these programs, as well as how to configure the MINT.CNF and GEM.CNF files. I'm sure that it's a rather simple thing to do, it's just that the anemic documentation of MultiTOS that came with my Falcon doesn't help me at all. In fact, there isn't even a mention of these two .CNF files in all the documentation that came with the machine!

Anyways, all help is greatly appreciated and I thank you for your time.

2285. Re: looking for Eidolon source or programmer

Newsgroup: comp.sys.atari.st
Date: 1993-08-08 01:51:59 UTC
From: wglahol@eis.calstate.edu
Message-ID: <CBF3uo.9G@eis.calstate.edu>
Source record: 202908

I'm not an Eidolon programmer, but I did begin work on developing Inner Sanctum 3 years ago, intent on developing Cit-86 style Networking into it. As of last month, I have finally succeeded in this project. I have installed a bunch of features into I.S. (which I now call "Intersanctum," since it is a networking BBS program), including a status window.

I have been netting for the last month with several Sacramento-area Novucivitas boards; In addition, I.S. now has limited ISIS-net support. If you'd like to see how Intersank has grown up over the last three years (not really much to see on the user end that's new since 1.76 - the version of software I used to build upon) but as I said, Cit-86 netting is now available... Call Cold Winter Knights, Sacto area bbs (916) 487-2819.

My handle is "Yellow Dragon."

I do appreciate the responce, but I am not looking to change BBS programs
yet again. WIll stick with what I have for now, but may take a look later
down the line.

As for the programmers of Eidolon; as far as I have been able to find out
they were:
John D. Walker and Lauren Guimont
handles, but not sure which is which:
Major Chaos and Ganelius

If nayone knows how I can get ahold of the above, please let me know, or
if anyone knows where I can get the source for this game program. Thanks

asmo

SCSI drives are way in now, its the way PC clones are now going and
the price here in N.Z. is the same as IDE..

People that push IDE because they don't know any better, should be shot...

I have just fitted 2 Quantum LPS240S (240meg) to 2 Supra boxes, they work
very nice, the Quantums are very cheap here, as cheap or cheaper than the
USA and far cheaper than the UK...

There is no Duty here on Computers or parts, only Modems....

Sounds like you need a real dealer..:-)

Roger..... sheppard_r@kosmos.wcc.govt.nz

Hi,

How is it with scuzzy drives nowadays? Word goes that they are 'still' being made. The dealer that I buy my computer supplies says that if he is to order a scuzzy drive for me he wants a deposit. What I am getting at is; what is the most popular adaptor for hard drives these days? What's the encoding method? Is parity checking standard now?

From: evanlang@sdf.lonestar.org
Message-ID: <CBFGv2.FBE@sdf.lonestar.org>
Source record: 202915

Can someone E-Mail me any info you have on this TT-Clone. Is it a computer that behaves like a TT but made by someone other than ATARI? This would be good news. What is the pricing like (in US dollars if you can).

What's this business about this Medusa board? A 40Mhz 68040? Sounds good.

```
============================ quote =======================
It still copies itself, but until it finds the other half (Which I have)
it does nothing. However, I had the 2nd half, and when it was accessed,
the machine crashed! Pretty sad virus!
==========================================================

Yep. I always wondered why my machine would crash after accessing a bunch
of different floppies (looking for something on backup). Come to find out,
I have the virus. Its supposed to invert the mouse, but this has never
happened. I think I got the virus from Toad, on a disk they sent me.
Its the only disk that it could have been. I didn't even find out until the
person I sold W9 to found the virus. The disk (which was a copy of Warp9 from
Toad, not Codehead) had the virus. I think that's the mother of the ones I
have. In any case, it was a either that or Codeheads disks, and they don't
have the virus, so Toad gave it to me. Maybe I'll call them.
```

```
============== quote ===========
the separate C and C++ compilers have disappeared when changing from
GCC 1.x to GCC 2.x
in the gcc doc, it says that running g++ is exactly like gcc except
for a few very little tiny detail. gcc compiles c++ files just fine !
================================

OK, I was confused because a.a.u.e says that g++ required gcc 2.3.2, and it
seemed stupid to get gcc 2.3.2 plus an extra MB or so of stuff (g++) if gcc
alone could handle it.

Thanks for the info. Any idea where to get Objective C libraries? And I
assume that I can take C, C++, Objective C, and Assembly, and link them all
together, plus perhaps link in one of the other "front-ends" for GCC like
Modula ][ ? GCC gets better and better, all we need now is a nice GEM
front-end with an integrated editor/debugger/tracer like Turbo C/Lattice
```

>are it's specs ?

The 68K in the STe is a PLCC, not DIL; ie. it's a rectangular chip that
resides on the right side of the main-board right under the arrow-keys.
It's specs is the same as the old variants of 68K.

Hi Michael-Dennis!

M>So what is the processor in my machine ?
You maybe have a PLCC-Version of the 68k Proc.
I don't know the location or the specs of the Proc in the 1040STe but take a look at the square chips in a socket.

Bye
Stefan

You may try JOVE. It is an emacs clone that I ported to Atari ST (among others). It is not a Gem application, but it does have some of its goodies:
- Mouse support,
- 8-bit character support,
- File Selector support,
- color display,

and of course all key (and mouse!) bindings are configureable.
If you're familiar with GNU emacs, you will see many similarities.
(except that JOVE is not the memory hog that GNU emacs is;-)

Jove is available with anonymous ftp at:
icce.rug.nl:pub/tom/jove/TOS.zip - binaries for TOS.

(binaries for MS-DOS, a complete source distribution and a set of LaTeX manuals are also available at the same location)

My guess is that it is a program from the dark ages;-) that writes
directly into screen memory and has the screen address hard-coded in. In
the old days the screen lived near just below 1MB...

Yup, I am replacing my ST-157N with an LPS240S as soon as I get a good deal. There are some good dealers over here. I know one who does not charge any taxes; that's probably where I am going to go. I checked with my resources and Quantum drives came up as an optimal choice for Mega STe's.

There is one thing that I am not exactly clear about, Roger. How can an ST handle multiple partitions that are bound to exist when one has multiple hard drives attached to the machine. If I am right, the available partitions are C to P (14 partitions). How close do the guys who have 800 to 2000 megs come to reaching the limit of how much ST can handle (address?) If there is a limit to BGM size, what is it?

Wow they must be seriously cheap over there, I just changed my internal
TT drive for a LPS240 for UKP 230 (price has since dropped to about #220).
What sort of prices are you talking for these drives?

>What are they, and what is an 68901 then ?

The 68901 is the MFP (Multi Function Processor). Basicly it's a combined
interrupt-handler and clock-generator, which is programmable. It generates
the clocks for the ACIA's that serves the MIDI-port, RS232 and keyboard.

I still have some Atari ST software for sale. Here is what I have:

WordPerfect 4.1 $50
GFA Draft Plus $10
IBM DOS 3.3 (for IBM emulators) $10
Ultima IV $10
Planetarium $10
GFA Basic 2.0 and 3.0 w/ ref manual $30
UltraScript $50
BBS Express! ST 1.79 $50
==========
Total $220

If you are interested, I (Chuck) can be reached at:

caude@ewu.edu

2305. How Do I make GCC compile C++ code?

Newsgroup: comp.sys.atari.st
Date: 1993-08-09 00:32:53 UTC
From: cmedley@wam.umd.edu
Message-ID: <2445vl$t0t@cville-srv.wam.umd.edu>
Source record: 202930
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm trying to get my installation of GCC to recognize and compile C++ code, and it very nearly does it except that I believe it is relying on an internal rule to run a program called:

cc1plus

instead of gcc-cc1+.ttp when it is required. I vagurely remember a separate environment variable was required to over-ride this rule. Can anyone shed some light on this?

(right now, i can still use g++.ttp and get the correct results, but if gcc.ttp can do it, then i figure I'll save myself a little extra trouble when I run into makefiles that need converting...)

Thanks in advance to any help anyone offers.

Thanks to all who helped me find Before Dawn. I got it from A.A. in
Utilities/Screensavers/Beforedawn

Things I have found:
a) This version is not the latest.
b) This version is MultiTOS compatible.
c) It is much better than anything else I've used before.

2311. Questions: Atari Corporate History

Newsgroup: comp.sys.atari.st
Date: 1993-08-09 10:11:03 UTC
From: etxansk@garbo.ericsson.se
Message-ID: <etxansk.744891063@garbod26>
Source record: 202939
Cross-posted to: rec.games.video.classic,rec.games.video.arcade,comp.sys.atari.8bit,comp.sys.atari.st

Could somebody please help me with this brief list of Atari's history?
I haven't been able to fill in the years for several important company
events. Any additional information is appreciated.

1972: The company, Atari Inc, is founded by Nolan Bushnell. Bushnell's
intention was to use the name "Syzygy", but since it was already
occupied, he picked "Atari" instead.
197?: The Pong game becomes popular in the arcades.
1976: The Atari 2600 is released.
1979: The Atari 400 and Atari 800 computers are released. The computers
had inofficial name, "Colleen" and "Candy".
198X: Nolan Bushnell sells Atari to Warner Communications.
1983: The Atari XL series is introduced, replaces the 400/800 series.
198X: The Atari 7800 is released.
1984: Jack Tramiel leaves Commodore and buys Atari from Warner. The company
is split into Atari Corp (consumer products) and Atari Games
(arcade games).
1985: The Atari 520ST computer is introduced.
The Atari XE series, compatible with the 400/800/XL series, is
introduced. (65XE, 130XE.)
198X: Atari buys the Lynx from Epyx. The Lynx was developed by XXX.
198X: The Atari TT computer is introduced.
198X: A portable ST named Stacy is introduced.
1989: The Atari STE series is introduced.
1993: The Atari Falcon computer is made available (?) to consumers.

It would be nice to have the names and years of introduction of some
popular arcade games as well. Since I was too young to take part of
the action in the early years, I can't remember what games were
created by Atari. Suggestions: Missile Command, Pole Position (Namco?),
Pong, Breakout, Galaga, Battlezone.

Anyone who's interested in this subject should feel free to edit the
list and send replies to my email address. I'll read the newsgroups
as well.

Thanks in advance,
Anders Skelander

Jan T. Kim (aeg03@rrz.uni-koeln.de) wrote:
: In <jonal.326.744471671@dhhalden.no> jonal@dhhalden.no (JON ARVID LOVSTAD) writes:

: I guess "video RAM" means "RAM that can be used for display by the video
: hardware" in this context -- usually, this is called "ST-RAM", and
: "Fast-RAM" is often referred to as "TT-RAM". Since ST-RAM has 24 bit
: addresses, so the upper bound for ST-RAM is 16 MB. However, it is 14 MB
: only because some of the 24 bit address space is used for ROM and
: hardware registers.
The term "video RAM" means in this case really "video RAM". It is not very
sensefull to use 14 MB's ST-Ram. In most cases 2MB are enough and the rest of your
money is better spent by buying fastram for your compi.
Video rams are not very expensive so it is cheaper use a videoport with videorams
but a difficult logic and less expensive DRAMS. Btw. You win some speed by using
this method and it is possible to use higher bandwith to get more colors and
higher refresh-rate onto the screen.

The mono and colour cables that you are indeed different. This is
because the mono and colour monitors use a couple of different lines
and in order to save money the ones not used are not included. The
wires just arent there... The pins are the same, though, so its quite
possible to make your own cable, so long as you can find at least a
9-conductor lead... But watch out when you take the connectors
apart... They have a tendency to violently explode! No kidding! I
lost the connector from my SC1224 that way. It was broken beyond
repair, so I had to kludge a connector with DB25s and the connector
from my SM124... Look at the pinout in the back of your ST owner's
manual and you'll see the differences...

scruggs> Also, would anyone here be interested in a firm that sells

2314. Falcon news (?) from ST Format

Newsgroup: comp.sys.atari.st
Date: 1993-08-09 10:37:31 UTC
From: lancer@rajeesh.WPI.EDU
Message-ID: <LANCER.93Aug9103731@rajeesh.WPI.EDU>
Source record: 202766

According to the July issue of STF, Atari plans to introduce the falcon minus the cartridge port in a real case in September! I think they said it was a black case with removable keyboard and internal expansion port! I'm kind of worried about the loss of the cart port, though. There are so many things that use it, it would be a shame to toss it... What are all the Spectre GCR users going to do? Or the high-powered MIDI users who use the port for extra MIDI ports?

Also, places in England are selling _new_ 520STFMs for L149! This looks that, despite Mr. Brodie's assurances to the contrary, Atari is indeed manufacturing more 520s! Either that or they "found" a warehouse full of 'em...

Oh, and check out the cover disk! It has a GREAT game on it called Colour Clash. It's worth the American price ($8.50) alone! I'll see if it's shareware... If it is, I'll upload it... if not, go out and buy a copy of the issue!

later,
.s.

The 1040STe has a 68000 (dunno if it's square or rectangular).
I *think* that the 68901 you saw handles some of the I/O, such as the
RS232 port (this is just based on memory of what Sysinfo gives on
one of its screens, if I remember right). If I'm off, I'm sure
someone will correct me (this is the internet of course :-)

Does anyone out there know how to run Multitos from the Desktop, ie without putting it in the AUTO folder ?

I've tried simply double-clicking on it and I get a message something like "If run from desktop need to specify a program using an INIT = line in MINT.CNF".

I tried this aswell and managed to get the 'lines.app' demo running. However I couldn't find a way to start any other programs or get the new desktop up.

Anyone got any ideas ?
I just want to be able to run TOS proggies in the background, I'm not bothered about multi-tasking GEM stuff (most of my GEM apps are too old and can't quite cope with Multitos anyway). Would MINT be able to do what I want ? Or does it need to be run from/with a shell (eg Gulam) ?

Thanks in advance for any help

Andy.

> the most popular adaptor for hard drives these days? What's the encoding
> method? Is parity checking standard now?

SCSI drives will be around for some time. Typically, SCSI is associated with higher end machines (for example, virtually all UNIX workstations use SCSI devices). As far as sheer numbers go, the PC IDE paradigm is probably the most popular (gaaack, cheap hamstrung SCSI, IMHO). SCSI is not particularly popular on PC's at this time, primarily due to PC manufacturers not being "dance on the bleeding edge" type folks (such an attitude would hamper the process of producing highly compatible machines). The rest of the world switched over to SCSI soon after SMD disks became passe'.

I have noticed that some high end PC's (typically in Novell network server configuration) are appearing with localbus SCSI cards (that is, there is a special bus on the motherboard for very high speed needs, like video and serious disk I/O). One might conclude from this that earlier PC busses did not have the potential bandwidth needed to fully utilize a fast SCSI device.

SCSI is nice. One can purchase all kinds of SCSI devices, including tape drives, flopticals, removable media hard drives, floppy drives, CDROM, DAT, Exabyte, WORM, etc. Given that you have suitable software drivers, they will work on any machine with a standard SCSI bus (or in the case of the ST, one that is really close to a real SCSI bus).

Parity checking is typically selected with a jumper on the device.

Subject: Atari Works and TOS 1.0?

I am having no success getting Works to run on my 1040ST with TOS 1.0,
has anybody managed this? When it loads it gets up to the point where
the title screen says "Initializing..." and then I get a dialogue that
says "Can't initialize scrap manager." and it exits back to the desktop
when I click OK (the only option). I have tried editting the .inf file
to set all the paths to A:\ to no avail (I only have a floppy drive
on the 1040). I have tried the Works fix for TOS 1.02 from a.a. .. no
joy. My copy of Works is V1.0. Any ideas would be appreciated.

Mark.

2324. DR T OMEGA/COPYIST

Newsgroup: comp.sys.atari.st
Date: 1993-08-09 16:42:22 UTC
From: hicksm@hindmost.lpl.arizona.edu
Message-ID: <245upe$42e@organpipe.uug.arizona.edu>
Source record: 202949

I've been looking around for sequencing and music
notation software for my soon_to_be_st and I found
a good deal on Dr T products by calling their 800
number directly (they are having a sale):

-Dr T Omega 2 Sequencer (a package of
various useful stuff) $99

-Dr T Copyist (music notation program:
outputs postscript!) $99

They each usually list in two hundreds and the best
package deal I was able to find was $389 for both
from a retail music software distributer. (but hey,
they were going to throw in a midi cable, wow!)

Here's a kind of related question. How come whenever I
call up or walk into a music retail place. (You know
the kind, they advertise things like "Musicians working
for Musicians!") I get this lame stoner guy who qoutes
me really bad prices and really doesn't know much about
what he is selling.

In fact, I think I get the same person no matter what
store I walk into. Pretty surreal. And pathetic.

-Michael

2325. *WEIRD* mouse problem!!!

Newsgroup: comp.sys.atari.st
Date: 1993-08-09 18:37:17 UTC
From: richardson@sscl.uwo.ca
Message-ID: <1993Aug9.143717.1@sscl.uwo.ca>
Source record: 202801

I'm not sure if this should be posted to .tech but here goes! just this past weekend my OLD 520STm (@1985, TOS 1.0, upgraded to 2.5 meg), developed a strange malady. The replacement mouse I have (a beetle mouse; which I have had about 1.5 yrs. with no problems) stopped working in med or low rez...2 days later it stopped working period! The buttons are still read, if I move the pointer with alt-arrow and then click its fine! The strange part is that the mouse works FINE with other ST's at my local Atari store (even on their Falcon!). Also, other mice work with my ST (including the old and heavy original mouse). Anyone ever heard of a disagreement between a computer and it's mouse? Both work independently, but they won't work together!!! Any hints would be appreciated.

From Falcon owners, and anyone who walks into their atari dealer and buys it.
it was released last month a week or so after the 'for sale' falcons
came out.

its 59.95 i think. It runs ok on my STe (4 megs ram).
Its beautiful on a TT.

2328. Experiences with Quantum LPS240, DVT backup

Newsgroup: comp.sys.atari.st
Date: 1993-08-09 19:51:12 UTC
From: sourada@iastate.edu
Message-ID: <sourada.744925872@vincent2.iastate.edu>
Source record: 202804

I may be buying a Quantum LPS240 hard drive and the DVT VCR hard/software backup device. I'm wondering what people's opinions and experiences with these products are. I'm pretty sure the LPS240 is good, but I don't know anything about the DVT. How fast is it? How long does it take backups to deteriorate? How likely is it that a backup will bite the dust if the tape gets a glitch?

Thanks a lot,
Steven Ourada

>to this, and recompile.
>
> --Jeff
>jeffmay@magnus.acs.ohio-state.edu

It had better not have CACHE_MODE set to ROBUST that's in breach of copyright if distributed like that.
Anyway anything less than 0.60 (i.e. 0.55) may be quite slow especially if used without caching disk software. 0.60 plx x<5 should be reasonable (not *very* slow). pl5++ should be quite a bit quicker. I would recommend using pl6 (source+binaries on atari.archive and elsewhere) because some nasty bugs are fixed.
As regards caching, Minixfs always uses it's internal cache (after all so does TOS). At present the cache sizes can only be altered by recompiling. *However* I'm working on a binary config util which can be used to change all manner of things and save them direct to the minixfs binary (well naturally).
TOS filesystems could easily be as quick as Minixfs pl5++ if the drivers were written properly, alas they aren't (I could write a fast TOSfs if asked, though not free of charge).
On a more general note, I wish Minixfs attracted as much attention commercially as it does here. I have to develop the thing with dated hardware, zero docs (i.e. no developer stuff) and free software.
Steve.

2331. Minixfs pl6 ...

Newsgroup: comp.sys.atari.st

In case anyone hasn't noticed I've sent Minixfs pl6 to atari.archive and ftp.uni-muenster.de . Mainly bug fixes for this version, some of which are nasty, so I'd recommend upgrading. I've sent binaries as well. The files are mfs606s.zoo and mfs606b.zoo .
Have fun, Steve.

2332. ScreenBlaster

Newsgroup: comp.sys.atari.st
Date: 1993-08-09 22:48:15 UTC
From: azog@world.std.com
Message-ID: <CBIKoG.5Jr@world.std.com>
Source record: 202807

I just got a ScreenBlaster for my Falcon. What a wonderful little device this is. For all those who were complaining about the rez rates of the Falcon, this is something to get around that.

Right now I am running at 1024*768 in 16 colour mode :-) (and using my newly registered version of Connect, it works just fine! I had to choose a different larger font to get a readable screen tho)

Ive tried it at different rez's, like 1280*mumble, but with my monitor, it was just short of unusable. This rez is just fine. Hell, for $100, its a lot more than I expected!

2333. Re: Objective C

Newsgroup: comp.sys.atari.st
Date: 1993-08-10 00:06:52 UTC
From: warwick@cs.uq.oz.au
Message-ID: <14810@uqcspe.cs.uq.oz.au>
Source record: 202809
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

There is heaps of confusion over all this GCC/G++/Objective stuff.

Here are the facts as I see them:

1. The *compiler driver*, called "gcc.ttp", recognises both
".c" and ".cc" extensions (among others), and passes
them to the appropriate *compiler* - either "gcc-cc1.ttp"
for ".c" files, or "gcc.cc1plus.ttp" [usually truncated
to "gcc-cc1p.ttp"] (actually, it passes them through the
preprocessor (cpp.ttp? gcc-cpp.ttp?) first).

2. If you are ONLY compiling .cc (C++) files, you do NOT need
the C compiler (gcc-cc1.ttp). But you need both the
compiler driver (gcc.ttp) and the C++ compiler (gcc-cc1p.ttp).

3. Regardless of what you are compiling, you need:

- The linker (gcc-ld.ttp) to link .o files to make a program.
- The assembler (gcc-as.ttp), since the compilers produce
Assembler code which they both pass through this.
- The C library (gnu.olb).
- The runtime code (crt0.o).

4. If using any libg++ libraries (eg. iostream.h), you also need
the c++ library (g++.olb).

5. In previous versions, there was a separate "g++.ttp" compiler
driver which understood ".cc", but not ".c", while "gcc.ttp"
understood ".c" but not ".cc". All that has happened is they
have combined them into one.

6. There is a Bourne shell script called "g++" that is distributed
with the code from FSF which does some minor things to make
"gcc.ttp" seem more like the old "g++.ttp" (for example,
it adds the "-lg++" automatically. I haven't used it -
it isn't worth the effort (and how does it know where
to put C and C++ libraries???)*.

7. The compiler driver (gcc.ttp) also recognizes ObjectiveC files
(".m" files), which it passes to the Objective C compiler
("gcc-cc1o.ttp"(?)). This also requires the Objective C
runtime code, which was included in at least one of the
"gcc2??bc.zoo" files ("a" is generally the C and shared
stuff, "b" is generally the C++ compiler, and "c" is the
ObjC compiler).

With all these requirements, you may as well get the C compiler (600K
or so compressed) along with all the other stuff.

* C/C++ libraries should be linked like this:

gcc {file.o} {-lC++Library} {-lg++} {-lCLibrary}

(although often it makes no difference)

This is the default when it cannot find "gcc-cc1plus.ttp".
(Using the GCCEXEC variable as a prefix)

>instead of gcc-cc1+.ttp when it is required.

This is the problem. This file should be called "gcc-cc1p.ttp". I guess
that the old "g++.ttp" program had "gcc-cc1+.ttp" coded in for some reason.

Like I said, when I switch between my online screen and the menu I
lose inverse video. I have to exit and run the program again. It's
a pain in the butt. And it's NOT full-color ANSI it's four-color ANSI.
I don't care about blinking text.

>exceptions!)

Okay, try this. Load a 100k text file into the text editor. Block off a
good portion of it with block markers (text should turn red.) Delete
the block. Now go eat dinner. Because by the time you're finished
eating it may be done with the operation.

Okay, I'm exaggerating. But it's AMAZINGLY slow. Apparently it's
doing a line-by-line deletion. It shouldn't do that. Or he should
at least write a faster routine. Jeeze man, it's fucking slow!
>
>It;s the most feature packed program around if you only have color and

Yeah, it's a nice package. But I find it annoying to have to exit
it all the time or call other programs externally. Maybe I'll have
to buy another computer if I want a decent terminal program.

: 1972: The company, Atari Inc, is founded by Nolan Bushnell. Bushnell's
: intention was to use the name "Syzygy", but since it was already
: occupied, he picked "Atari" instead.
: 197?: The Pong game becomes popular in the arcades.

Hmm...I think Pong became popular in 1972 as well.

: 1976: The Atari 2600 is released.
: 1979: The Atari 400 and Atari 800 computers are released. The computers
: had inofficial name, "Colleen" and "Candy".
: 198X: Nolan Bushnell sells Atari to Warner Communications.
: 1983: The Atari XL series is introduced, replaces the 400/800 series.
: 198X: The Atari 7800 is released.

1984 I belive..then never to be seen again until like 1986 or so.

: 1984: Jack Tramiel leaves Commodore and buys Atari from Warner. The company
: is split into Atari Corp (consumer products) and Atari Games
: (arcade games).
: 1985: The Atari 520ST computer is introduced.
: The Atari XE series, compatible with the 400/800/XL series, is
: introduced. (65XE, 130XE.)
: 198X: Atari buys the Lynx from Epyx. The Lynx was developed by XXX.

1988-89??

: 198X: The Atari TT computer is introduced.

1989?

: 198X: A portable ST named Stacy is introduced.

Ooh...'89 I'd say. What ever happened to this thing? Does it still
exist? What are the capabilities? How much does it cost????

: 1989: The Atari STE series is introduced.
: 1993: The Atari Falcon computer is made available (?) to consumers.
:
: It would be nice to have the names and years of introduction of some
: popular arcade games as well. Since I was too young to take part of

: the action in the early years, I can't remember what games were
: created by Atari. Suggestions: Missile Command, Pole Position (Namco?),
: Pong, Breakout, Galaga, Battlezone.
:
: Anyone who's interested in this subject should feel free to edit the
: list and send replies to my email address. I'll read the newsgroups
: as well.

Yeah, what's AtariGames' relationship with Namco anyway?

>
>-Karl
>hansen@cs.wmich.edu
>

I used to use an old 20 meg Supra myself. I upgraded after I got the Spectre 128 to use a Seagate 80mb SCSI hard disk that worked fine pretty much out of the box with the only hitch being that it fried my 20 meg when I tried to put them in series. (The Seagate faired the weather well however and still works more or less today)

A friend of mine who was big on the Atari scene at the time told me there was a voltage pin on the cable that was needed for the first SCSI device, but needed to be lifted from the cable between the first and the second pin.

For what it's worth I don't remember what number the pin was, but it certainly did toast that first drive. It never did work again, as far as I know (I hate hard disk repairmen, I wonder if they all aren't scam artists..I've NEVER had a single hard disk that was actually fixed that I didn't fix myself)

I just downloaded it and tried it out, but directly after opening the
three windows the game crashes with four bombs. I own a Mega ST 4 with a
Crazy Dots graphic card. nh311gem (the first release) worked on my
configuration (after I converted the icons?.pi1-files), and I've never
tried release B or C, so I don't know if they would work.
Did anyone else encounter this problems?

2351. New source-only version of my BSD-like init package for MiNT.

Newsgroup: comp.sys.atari.st
Date: 1993-08-10 09:11:18 UTC
From: steve@earth.ox.ac.uk
Message-ID: <1993Aug10.091118.11979@zaphod.earth.ox.ac.uk>
Source record: 202777

I've just uploaded to Atari.archive a source only distribution of the latest version of my init package for MiNT (New/inisrc11.tgz and New/inisrc11.readme1st).

This is a source only distribution as you'll need to know what you're doing to extract and compile it!

Firstly, you'll need to have GNU gzip and GNU tar handy and to have a Minix partition with about 3MB free to extract the archive easily, though you could get away with about 1.5-2 MB if you decompress the archive on another partition.

You'll need a Minix partition as some of the files in the archive have names which won't fit the TOS 8+3 format.

What does this archive contain I here you ask...

It contains:-

ac(8)
A rather full etc directory
finger(1)
getty(8)
An include directory for stuff which may not be in mintlibs
(Please ignore and remove the syslogd.h file, sorry, slipped in)
init(8)
last(1)
A lib directory holding such things as an implementation of writev
login(1)
su(1)
passwd(1)
As many manual pages as there were before. (oops! :-))
A version of Ash, I can't remember if this is the version I modified to handle "for i do...done" loops.
who(1)
wlogin
syslog - the complete (well almost) BSD release version.
write(1) This version should now work!

I think that'll do for the time being.

The binary version won't appear until I've written a complete installation system for the package which will include all the programs needed to get a full BSD-like environment running. Don't hold your breath!

Steve

PS. This is really directed to Stephen Henson etc..
I found a problem when using syslogd on a Minix filesystem, I'm including
the notice I've placed in the syslog directory warning of the problem below:-

--8<-- Cut -- Here --8<--
There is a possible problem with MiNT or some versions of the Minix
filesystem device driver which may either cause MiNT to lock up or the
system log daemon to die with a "hardware" access violation when run on a
machine with memory protection.

If /var/adm/messages is read by a program whilst syslogd is running, the
next time syslogd tries to write to the file it will crash. If
/var/adm/messages is read by a program more than twice, on the third time
MiNT will seize up completely.

This problem was found whilst using MiNT 1.07 and Minixfs version 6.0
patchevel 4.

2352. ICD Hard Disk Software

Newsgroup: comp.sys.atari.st
Date: 1993-08-10 09:27:45 UTC
From: Patrice.Lacouture@aedi.insa-lyon.fr
Message-ID: <247pmh$2oi@cismsun.univ-lyon1.fr>
Source record: 202826
Cross-posted to: comp.sys.atari.st,fr.comp.sys.atari.st

This morning I sent this E-mail to ICD:

--0----------------
Dear ICD,

I am a regular user of one of your SCSI Host adapters for the Atari ST/TT computers.
Like most people in my case, it is impossible for me to get the latest releases of the disk drivers and utilities, which are meant to be freely available though.
Since I bought this product and sent my registration card, I never recieved any update of the software part of the package, as it was implied in the registration card, and the version that I own is now fairly out of date.
It is impossible for me to use your US BBS, since:
- I don't have any modem
- The cost of the communication is far too high from my country to the US.
I know there are other BBS in the world, but they don't solve my problem either.
Furthermore, I don't have any access to Genie nor Compuserve. The only way for me to get the newest release of the ICD driver/Utilities will be to copy them from another comsumer (US no doubt) who managed to get it legally or not, unless you give me another idea.

I think you should find a solution to this problem, in your own interest: the Atari community seems to agree in the fact that you provide the best product of the market of ICD adapters, mainly thank to your very good software... Don't let other people outperform your marketing policy, that will make the difference.

I just open the discussion about this, but I think there are many possibilities for people who access the Internet. You could use ftp, mail, whatever...
Installing a password system that allows only regular owner of your product if you want, why not ?
And find a solution for all the people who don't have any modem, nor access to any network at all, and are your client though.

The discussion is still open.

Thank you.

Patrice LACOUTURE

All of you who have this problem are invited to let ICD know... You can even use parts/totality of this text if you want...

As I was said a few minutes ago: "They are clearly aware of the importance of customer support (hence the BBS). They just need to have a larger view of the *world*!"

(E-mail me if you want to know who the author is :-)

Minix is a commercial product.. It will not cost execcively much (I think
<2000 Francs in France).
If you don't need all the features of Unix, but mainly the filesystem, consider
using Minixfs with MiNT on your F030.
Someone posted an article a few days ago about a future ST port of Linux...
Search for it in this newsgroup.
The only Real UNIX system was Unix System Vr4 provided by Atari with some TTs
but dunno what it became...

Message-ID: <millinr.744978043@p4.cs.man.ac.uk>
Source record: 202747

I was wondering if anyone out there could help me out...

How can I get an ST to make a noise with 68000 using just MOVEs... I can do it with the system 'dosound' routine, but wanted to do it directly, any ideas ?

Next thing... has anyone got any decent envelope sounds for the st ? I've got the standard gunshot and explosion sort, but does anyone have anything really good using just the sound chip registers ?

Any replies would be much appreciated... If you could mail me any response that would be loads better as I don't really read this group much...

Thanks...

> mentioned above.

You can actually get up to 80 extra MIDI channels by using C-LAB/Emagic s
Unitor and Export aditional hardware. The first one plugs into the
cartridge port giving extra 2 x 16CH - thereby replacing the key - the
other one into the modem-port giving extra 3 x 16CH. You can use either or
both of them. Steinbergs products - primarily CUBASE - supports the extra
ports too, I don t know if any of the other manufactures does.
(Notator LOGICs cartridge-key LOG3 has 3 extra MIDI-ports build in -
replacing the old Export for the SL).
However, what is really needed is a standard expansion device supported by
all softwaremanufactures. Like "MOTU MTP" on the Mac, always the Mac ;-)

Now then we only need the same thing to happen for the OS. If you take all
good efforts made so far (such as WINX) together, people must have re-built
GEM about five times, so if we join forces we would be able to come up
with a better alternative for MultiTOS (but 100% compatible) in, well,
four weeks' time?

Help!

I got AIM 3.1 beta some time ago and i'm going to like it.
But there is one nasty bug in the HPLJII printer driver:
Every second line is indented by about 1.2 mm (0.1 in) (32 dots ??),
which looks really ugly in small magnification and quiete bad
in larger.

Since i have changed some of the ESC-Codes in HPLJII.PRT i don't
think it's the wrong code send to the printer, but rather an error
in the copy loop, which skips one longwort every second line.

BTW, i'm using a deskjet500, i can't test the driver on a proper LJ.

According to what i've seen, AIM will be one of the best programs
to print a truecolor image on a LJ / DJ.

(Of course AIM crashes some times and it doesn't like MiNT very well,
but it's still a beta version, isn't it)

Actually it only covers till about 84 when Tramiel took over and it doesn't
say alot about computer part.

you can have a look at several ftp-servers in germany just like
ftp.uni-muenster.de or ftp.uni-stuttgart.de or ftp.unipaderborn.de
and have a look in the folder telecom(m) for the files
conn* or rufus* or trap* or uniterm*
these are all modem shareware-prg's.

hi!
What I know is that this program's code most uses dsp on falcon.
I don't know how much cpu-time will be required for handling.

2367. Atari Corporate History - 2

Newsgroup: comp.sys.atari.st
Date: 1993-08-10 13:17:40 UTC
From: etxansk@garbo.ericsson.se
Message-ID: <etxansk.744988660@garbod26>
Source record: 202840
Cross-posted to: rec.games.video.classic,comp.sys.atari.8bit,comp.sys.atari.st,alt.games.lynx

This is an updated list, thanks to all who replied. It still isn't accurate, if you feel you can make a contribution to it, please send me any information you've got or write a follow-up.

I've also received replies with some interesting information about Atari products that (to my knowledge) aren't widely known. I'll add them to the list later.

I'm doing this research in order to complete a dictionary on video games and home computers. It's written in Swedish, and it's only for fun, but I find the Atari stuff particularly interesting. That's the reason to why I posted this article and the original question.

I'll order the book recommended by some people in replies to the previous article, the book is called "The Rise and Fall of Atari", many thanks for this hint. But any observation done by people "out there" is still interesting, since it may bring up some undocumented facts, opinions etc on the subject.

Thanks in advance,
Anders Skelander

1972: The company, Atari Inc, is founded by Nolan Bushnell. Bushnell's intention was to use the name "Syzygy", but since it was already occupied, he picked "Atari" instead.
1972: ??? The Pong game becomes popular in the arcades.
197X: Pong is released as a home system.
197X: The Atari 2600 is released. The 2600 is based around MOSTEK's 6507 CPU, and offers a ??? * ??? pixel resolution and a, for the time of release, huge, 128 colour palette. Game size is typically 4 KB to 8 KB.
1978 ??? Atari release there first pinball machine.
1979: The Atari 400 and Atari 800 computers are released. They are 6502-based 1,74 MHz machines with graphics ranging from a 40 * 25 text mode up to 320 * 192 pixel graphics. In lower resolutions it's possible to use colours from a 128 colour palette, or even 256 colours simultaneously in a special mode. Audio is four-channel sound based on analog synthesis. The computers had inofficial names "Colleen" and "Candy".
1980: ??? The production of Atari pinball games is discontinued.
198X: ??? Nolan Bushnell sells Atari Inc to Warner Communications.
1982: The Atari 1200XL computer is introduced with specifications similar to the 800s, except that ???.
1983: The Atari 600XL and 800XL computers (the XL series) are introduced, with specifications similar to the 800's. XL replaces 400/800.

1984: Jack Tramiel leaves Commodore and buys Atari from Warner. Atari
is split into Atari Corp (consumer products) and Atari Games
(arcade games).
1985: The Atari 520ST computer is introduced. It's a 68000-based 8 MHz
computer with 512 KB RAM, graphics modes from 320 * 200 pixels
in 16 colours from a 512-colour palette up to 640 * 400 on a
monochrome monitor. Audio is created by a three channel sound
chip using fairly simple analog synthesis. Digital Research's
graphical user interface/operating system GEM is included. The
ST computer has a built-in MIDI interface.
The Atari XE series, compatible with the 400/800/XL series, is
introduced. (65XE, 130XE.)
1986: ??? The Atari 7800 is released. It can run 2600 games, but is
also a vast improvement over the 2600, with impressive video
capabilities in ??? colours and resolution up to ??? * ??? pixel
graphics. Sound is the same as in the 2600.
1987: ??? The Atari XE/GS video game, based on the Atari XE computer
series, is released. It can run old Atari 8-bit computer cartridges,
a few new games are released. A lightgun with some shooting games
are also released.
198X: ??? Atari buys the Lynx from Epyx. The Lynx is a 6502-based (4 MHz)
portable colour video game with a built-in 3.5" colour LCD
screen. Graphics resolution is 160 * 108 ??? pixels in 16 colours
out of a 4096 colour palette. Sound is four-channel mono. Lynx
cartridges can hold up to 256 KB ??? of code, the machine's
internal RAM size is 64KB. The Lynx has remarkable sprite
scaling capabilities.
198X: ??? The 68030-based 16 MHz Atari TT computer is introduced.
198X: ??? A portable ST computer named Stacy is introduced. It's
specifications are similar to the original 520ST computer. Stacy
has a built-in monochrome LCD screen.
198X: ??? A palmtop PC computer, the Atari Portfolio is released. The
Portfolio was developed by XXX in the UK.
198X: ??? The ST-Book (?) is introduced.
1989: The Atari STE series is introduced. The 520STE offers better
graphics hardware than the older ST computer, with hardware
scrolling and a coprocessor for copying chunks of data in
memory, a "blitter" chip. Audio is also enhanced with two-channel,
stereo, 8-bit PCM-sound.
1993: The 68030-based 16 MHz Atari Falcon computer is made available ???
to consumers.

This is a brief list of arcade games made by Atari/Atari Games:

1972: Pong
1976: ??? Breakout
1979: Asteroids
1981: ??? Missile Command
1981: ??? Tempest
1981: ??? Centipede
1983: Pole Position (developed by Namco)

Source record: 202842

Ok, so with everyone forking out their own customized versions of
Nethack 3.1.3 I thought it was time to make the real thing :-)
available as well. It's now on wowbagger.pc-labor.uni-bremen.de
(134.102.228.9) in directory pub/atari_st/games/nethack31

The binary will work on any ST/TT/STe/Falcon with at least 2 Megs of
memory. There are no TT-only, 1 Meg or floppy-disk-only versions yet,
these will follow on request.

As usual, correspondance of any kind is welcome.

Have fun,

Christoph

You might want to try the Mutt editor. It is like emacs in many ways
(i.e. very powerful), but is much smaller. A friend of mine, Mike
Brandt, has written a GEM interface for it. The whole thing is
available on a.a.u.e in the editor directory, look for me2.

2371. PB Diskmag is now available from Umich

Newsgroup: comp.sys.atari.st
Date: 1993-08-10 14:31:23 UTC
From: an18359@anon.penet.fi
Message-ID: <143302Z10081993@anon.penet.fi>
Source record: 202846
Cross-posted to: comp.sys.atari.st,alt.cyberpunk.movemment

Just a short message to inform people reading this that PB Diskmag is now
available from archive.umich.edu anonymous ftp in the directory
atari/Magazines/Diskmags (Note the capital letters) in an archived form.
To be able to run each issue you need a couple of things....
1) One or two disks (one for PB #21, two for PB #22 and PB #23).
2) An lzh archive/de-archiver (since it's in .LZH form!)
3) Magic Shadow archiver. (Get the decent version!)
4) An ST or STE (since that's what it runs on. :))
5) One or two braincells in order to appreciate our brilliant work!! :)

If you've never heard of PB (If not you soon will!) then it's currently the
best diskmag on the ST scene, in our area. :) :) It's also probably one of the
most widely spread diskmags coming from Britain, mainly because Ledgers is
dead!!!!
But enough about how great we are. :) :) :) What sort of diskmag is PB?
Well, we report on issues. :) Of no importance to lamers. :) We go in-depth
on issues on the cutting edge of the Atari scene, who is doing what, why and
how. We also report on the varied and "unusual" character on the ST scene
(eg Powerman of TWB :) :)). We're now starting to get into network issues
such as this brilliant news service!
PB #23 will be available soon, and will contain......
- Reviews of the latest demos, including Falcon demos!!!!
- A look at the latest diskmags!
- A review of the STV programme on piracy.
- A look at Multi User Dungeons + talk from MUD users
- Live reviews of Belly and One Dove
- Film reviews
- Very nice intros by Flowerman (so he says!)
- Our best user interface yet!!!!
- Completely Falcon incompatible- guaranteed!
(... But it doesn't work on an Amiga either. :) :))
- Our usual incisive (?) news and comments!

SO GET IT NOW... ER, SOOON!!!

It seems to be still existing, since my local dealer has some in demo...
The price was over 10 000 FF , but must have rose down since then...
Quite a bit :).
But it has never been really sold... Only interesting for musicians... They
had problems with power supply, as far as I remember...
The capabilities (and the interfaces) are the equivalent of a 4 Meg/48 Meg
STF (with TOS 1.04, though), with blitter.

>
>: 1989: The Atari STE series is introduced.

1991 ? 1992? : a notebook called St-Book is introduced:
at least 1 meg RAM, 2.5" Hard Disk, no internal Floppy (but interface)

At the same time a notepad (without a keyboard, but a pen screen) is anounced..
What did it become ?

2374. unix windows...

Newsgroup: comp.sys.atari.st
Date: 1993-08-10 15:18:32 UTC
From: lancer@wpi.WPI.EDU
Message-ID: <LANCER.93Aug10151832@wpi.WPI.EDU>
Source record: 202767

I found a copy of a great program for the ST in the wuarchive usenet archives... It's called uw and apparently is a terminal emulator... (I'm using it to type this!)

It apparently lets you do some sort of multiple session windowing thing when a host program is running on the UNIX side. Does anyone have more info on this? Where can my site get a copy of the UNIX host?

thanks...

>>198X: Nolan Bushnell sells Atari to Warner Communications.

I thought Atari Inc. was in Warner's hands most of the time. The "198X" figure strikes me as wrong. Didn't Nolan sell the company to Warner soon after Pong became popular? In any event, I think all 400/800 computers were released under Warner.

>>198X: Atari buys the Lynx from Epyx. The Lynx was developed by XXX.
>
> 1988-89??

Probably late 1988 or early 1989. The machine was nearly complete then; all Atari had to do was tool up the factories. The Lynx was officially released in New York and Los Angeles in December, 1989. I remember not seeing it in L.A. until three or four days before Christmas, which puts it in mid-December.

>>198X: The Atari TT computer is introduced.

It was a stock monochrome ST computer (1 or 4 megabytes of RAM, I believe) in a luggable case.

>>It would be nice to have the names and years of introduction of some
>>popular arcade games as well.

A quick search through the "Killer List of Video Games" (see rec.games.video.arcade) should turn up every title ever made.

> Yeah, what's AtariGames' relationship with Namco anyway?

Whatever it was, I think it's dead. Probably a distributorship deal more than anything else. I mean, until recently, all of Namco's games were carried by either Atari Inc./Atari Games (XEVIOUS, PAC-LAND, ASSAULT) or

Bally/Midway (PAC-MAN, MS. PAC-MAN, etc.). Only with the very recent stuff has Namco handled it on their own (SOLAVU).

I'd like to see an explicit listing of the agreement between Atari Games and Atari Inc., myself.

Looks like it's "old 8-bit favorites for the ST" month. First we got Donkey Kong (ala Kid Kong, and available at the umich archive site) and now Frogger is released. Could someone who has this file either e-mail it to me, or post it to the umich archive site?

Now if we could only get an ST version of Mr. Do......

Extracted from AEO 2-13:

FROGGER is Frogger!, a remake of an old 8-bit game now done by Dave Munsie. The object of the game is to move your frog through hazards like cars and other objects in order to make it all the way to one of the safe froggy homes on the <other> side of the screen. Use your joystick to guide the little critter. I have enjoyed playing this game. The colors are bright and attractive. The game is easily controlled. Color only with any amount of RAM. ST--TT compatible (should work on a Falcon, too). Donationware.

>Ignore me.

I have been using the DVT for a couple of years now and while it does work, it is far from the ideal back up system. It is pretty slow - takes a little over an hour to do 40 to 50 meg. It is not terribly reliable either. I almost always have tape dropouts here and there and that is with using brand new tapes (although I don't always use the high qaulity tapes as suggested). I don't really know if it deteriorates over time - I usually have the back up on a tape for a couple of months (putting new back ups on new tapes) and retire the old tapes for use with the VCR or camcorder.

Another problem you may find is compatibility with recent VCRs. I use an 8 year old VCR and one time when it broke down I tried several new VCRs and none of them would work reliably with DVT (lots and lots of tape dropout). I ended up getting the old VCR repaired.

Although it has worked okay for me and, relatively speaking, it was pretty cheap when I bought it (compared to a $900 tape back up system), I'm not sure I would recommend it to anyone. You need a lot of patience and the restore software is not that great either (at least my version - I don't know what the latest is, but I don't think it is supported anymore).

Hope this helps.

2379. Falcon sector editor??

Newsgroup: comp.sys.atari.st
Date: 1993-08-10 16:56:46 UTC
From: saj@chinet.chinet.com
Message-ID: <CBJz2M.40u@chinet.chinet.com>
Source record: 202765

Now that I have a basically comfortable working environment on my shiny new Falcon (to everyone who helped, THANKS!), it's time to gild the lily a bit. I'd like to have a sector editor. Seems like every hardware change means a new one--drfloppy on the ST, memfile on the Mega....now what? Memfile just doesn't seem to like the 1.4 M floppy (and maybe some other things). Ability to work as BOTH application and accessory is a definite plus. Any recommendations (other than getting lost)?

I guess I may as well mention another 'situation': I have a BMS tape backup unit running (on the Mega) under Beckemeyer's Hard Disk Toolkit. The driver thinks it installs right on the Falcon, but overall, the backup doesn't work. Has anyone gotten this hardware to work on the Falcon (preferably, but not necessarily with Toolkit)?

One last bit....News is just a tiny bit unreliable here on chinet. By all means post replies of general interest, but if you have the answer to all my problems (or need to 'straighten me out'), please mail me also.

Steve

>hints would be appreciated.
>

Well when I got my Beetle mouse I had some strange problems as well. I had a SMPTE box plugged into the second mouse port and the RS-232 port. The Beetle mouse wouldn't work with this configuration but the Atari mouse worked fine. If I removed the SMPTE box both mice worked. I think that the Beetle mouse draws more power from the mouse port than the Atari mouse and you may have a power problem with that mouse port in that it doesn't have enough to drive the mouse? Of course this is just a theory.

Ok, thanks to the respondents on my question about the DVT backup system... It looks like that's not a good option.

So, my second choice, although expensive, would probably be a floptical drive. My main concern: if I get a SCSI floptical, will ICD's hardware/software be able to use it? If not, though, I have a dim recollection that someone has a floptical made for the ST series...

Thanks again,
Steven Ourada

That's a problem with this new version, some transfer protocols round up the file-size to the nearest 1k, causing Lharc 2.2x to think the file is 'garbaged'. The only way I've found around it is to either specifically request extraction of the file, or to use 'x [source] [dest]' rather than just '[source] [dest]' (Probably when using the 'x' command you should also use the -x and/or -r switches to extract directories in the archive! This worked last time I downloaded something with Y-Modem G!

>This is the first time in 5 years that such I ever heard sucha thing...

I could be wrong, but here is what I have heard/observed:

Since the color monitor is an RGB, it has lines not used in the MONO
cable. However, these lines do not conflict with the mono lines, so a
"full" cable could be used for both signals.
`
The dirrerence that matters is apin that tells the ST if it is a
color or mono monitor. If you have an external switch you will see that
the ST reboots when the monitors are switched. You have to know which
line that is so that you can tell the ST which monitor you have.
Presumeably you ground the signal to tell the St one thing, and give it
+12 (maybe +5, but 12 seems more likely for monitor) for the other
mode.

Not even close. The KLOV is real nice, but it's full of holes, especially
in the early days. As a prime example, Ramtek, where I worked for a number
of years and which was for a while the number two video game producer, is
not mentioned in the KLOV at all - the same situation applies to several,
if not many, of Atari's earliest games. But then, so many of us who were
around this are suffering from senility by now :-)

2398. How do I Port GCC (mainly, Objective-C) to ST?

Newsgroup: comp.sys.atari.st
Date: 1993-08-10 22:58:51 UTC
From: cmedley@wam.umd.edu
Message-ID: <24997b$6p9@cville-srv.wam.umd.edu>
Source record: 202772
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.lang.objective-c

I'm trying to learn Objective-C, but since there doesn't seem to be a version of gcc-cc1o.ttp floating around, I wanted to try to compile it myself from the latest sources. The problem is, I've now got a 19MB .tar file sitting on my account here at school, and I have no idea how to get this ULTRIX box to build a cross compiler for the Atari ST (the distribution doesn't include a configuration for the Atari ST in its m68k directory) in order to make the compilers for the Atari.

If anyone out there could give me some pointers on how to do this (or just get started) I'd be eternally grateful....

(I'm tempted to bring all the source required for Objective-C down to my current GNU C on the ST and try to compile it on here... but even so, I'm not sure that would guarantee success...)

2399. MultiTOS: Why does it start NeoDesk?

Newsgroup: comp.sys.atari.st
Date: 1993-08-10 23:20:27 UTC
From: dud@stein.u.washington.edu
Message-ID: <249afr$ih3@news.u.washington.edu>
Source record: 202775

I've been having a very strange problem ever since I installed Geneva on my TT. Whenever I try to run MultiTOS, it attempts to start NeoDesk3. I assumed it was one of these:

1) I was running NEOLOAD in my auto folder.

2) I was running Geneva (which calls NeoDesk) as an autoboot GEM program from X-boot.

3) I had either NeoDesk or Geneva installed as an autoboot GEM program in the NEWDESK.INF I use with MultiTOS.

4) I had a line in my MINT.CNF or GEM.CNF file that tells it to load NeoDesk.

But none of these are true! I don't understand it! As soon as MultiTOS loads all the accessories, an alert box comes up saying I must run the 3.04 version of NEOLOAD before I can start NeoDesk, then I get a bus error and the system locks up. If I change NEODESK.EXE to NEODESK.EXX, MTOS boots up fine.

Anyone have any ideas?

Around 1984-5 or so, Atari had publicised their Sara chip at the CES, which apparently contained 16K of ROM. Whether this was actually ever used in a published I don't know.

It is also worth noting that some cartridges also contained small amounts of RAM to suppliment the meagre 128 bytes in the RIOT chip. As there was no R/W line to the ROM, this was usually implemented by mapping the read for these locations to one address, and the write to another. Unfortunately, this also bit into the small 4K ROM space, which was tight enough already!

BTW, does anyone actually know what the mechanics of the commoner bank-switching schemes used on the VCS were? I've never actually found any information on this.

Ian.

Yes, indeed. Two players, two missles, the playfield, and the ball. There was a programmer's spec posted here awhile ago. I did not want to overburden the net with detail however.

>
Well, until Activision appeared, almost ALL games did their processing on every other scan line. After Activision appeared, almost all of them do it on every scan line. Also, I think Activision pioneered the hi-res six-digit scoring. Most games draw on about 180-200 lines, scanning every line except the old ones [Missle Command does some things every line; others things every other]

>[2] Horizontal resolution: 160 pixels
> Vertical resolution: Standard NTSC non-interlaced [~220 on most sets]

Almost all games used vertical resolution of 192-200 lines. Anything beyond that gets into the overscan region on some sets (especially older ones).

> Colors : Eight grays plus eight shades each of 15 hues

The last two hues were generally the same as the first two, giving an actual usable color space of about 104 colors. The PAL version of the chipset had fewer usable hues than the NTSC version did.

There were some carts bigger than 8K. I believe that Epyx' Winter Games was 16K.

>floptical made for the ST series...

Yes, ICD's SCSI Pro software and I think their Link software will work
with a floptical. I'm using a floptical on my TT.

Actually, a little while ago I was comparing the price of the new Syquest
105meg drives and their bang/buck ratio looks a little better than the
flopticals. Take a serious look at these.

Then, for the long term investment, there's the magneto-opticals...

] Like I said, when I switch between my online screen and the menu I
] lose inverse video. I have to exit and run the program again. It's
] a pain in the butt. And it's NOT full-color ANSI it's four-color ANSI.
] I don't care about blinking text.

Try making ST-Medium show 16-colours with an 80*25 screen, and enabling
the screen to keep up with 9600bps! ANSI-Term is *THE Only* ANSI
emulation program that lets ST's show 16-color ANSI! (e.g. the STFM
you would have purchased, not with graphics cards etc.) Apparently
some folks have gotten 16-col's out of it on TT's etc. (Anyone!?)

] >Well, it's got a better 'text editor' than any other comm's package I've
] >seen - all the others just have an editable capture! (with minor
] >exceptions!)
]
] Okay, try this. Load a 100k text file into the text editor. Block off a
] good portion of it with block markers (text should turn red.) Delete
] the block. Now go eat dinner. Because by the time you're finished
] eating it may be done with the operation.

It's a comm's program, not a word-processor! Besides, in GFA basic,
there aren't many easy ways of doing this without resorting to means
which would probably screw up something else (In-line assembly may be
okay, wait until v3 - that should be at least First-Word+ speed)

] Yeah, it's a nice package. But I find it annoying to have to exit
] it all the time or call other programs externally. Maybe I'll have
] to buy another computer if I want a decent terminal program.

Try Telemate 4.10 on the PC.

The 2600 came out November 1977, and Warner bought Atari in 1976.
I got this from the book Zap! The Rise and Fall of Atari, by
Scott Cohen, McGraw Hill, 1984. The book covers everything up to
mid 1983, when Atari was beginning to shrink. I think Nolan
Bushnell left Atari in 1979.

On NTSC, at least on my machine, all hues are different; they work very nicely as a color wheel and since they are derived from progressively shifting the 3.58MHz clock, the hardware to implement them is cheap. I will grant, however, that adjacent hues tend to be very close; this is to be expected given that there are so many of them [15 hues is really quite a lot]. BTW, on my Atari the lightness values are noticeably non-linear: 3 and 4 are far more distinct than 2 and 3, or 4 and 5.

Hmm... California Games wouldn't surprise me at all if it were 16K [though I'd be disppointed--I gave them so much credit for 4 good events averaging 2K each... :-?] Winter Games didn't seem to have as much good stuff in it.

2419. Nifty PD SW for 1040 with TOS 1.0

Newsgroup: comp.sys.atari.st
Date: 1993-08-11 06:38:39 UTC
From: vsnyder@math.jpl.nasa.gov
Message-ID: <24a45f$qig@netline-fddi.jpl.nasa.gov>
Source record: 202795

My brother has come into a 1040 ST with 1 MB, TOS 1.0, and a hard drive.

I remember that there was a problem with the way TOS 1.0 does FAT scans, and there was a PD program that repairs the problem.

Does anybody remember the name of the program, and an archive where it can be found?

Does anybody have suggestions for other programs to repair other defects in TOS 1.0? (I already found headstart).

E-mail please, as I don't have an ST any longer, so I don't read this column.

Thanks in advance,

>around here and I want to know if I will be able to use them in my
>ST... Also, is it possible to modify the ST to take SIMMs without one
>of these RAM boards?

I have updated many many ST/MEGAS with SIMMS 8 or 9 bit ones. my machine has a board, Vero matrix suff with 4 SIMM sockets, its mounted like the Xtra Ram I think next to the PSU and Disk Drive on top of the metal shield, but its not one of these plug in types, I would rate the plug in upgrades at -%100 as they plug into the top of the MMU, and this was never designed for this, they can be very unreliable.

On the ST and Megas I just stick the SIMMS down with double sided tape and some times the use of a hot glue gun...

You must use SIMMs that have holes in the contacts, some don't as they are filled with solder...

There are some files on a few FTP sites, one I know for SIPPS and one for SIMMS but there are a few admissions and errors in there Doc's...

The SIPP one is clever in using IC sockets for connectors, but has to be mounted were there is vertical room, the articles refered to the space were the modulator is normaly fitted, but then most machined here have a modulator..

I used the SIMM article with a few changes, the SIMMS are just stuck down on the mother board, were depends on the type of board, with the type that has ram under the PSU, I monted the SIMMs just in front of it, they are stuck onto the tops of the IC's and also a blob of hot glue is used as well..

There are a Few MMU's that can't use 2.5 megs and some other limite, there was a list of these MMU's in a ST-Format but I don't have that copy, silly me, I even have a copy machine...

```
Hi,
I'd like to save the printer output to a file, to be able to
print it somewhere else. Does anybody know about a utility that can
do this?
I've heard somebody mention m_spool, which was supposed to be in
the atari archive in the Printing directory, but I couldn't find it.

Thanks in advance.

x740756@server1.tiuk.ti.com (Andrew Bianchi) writes:

>Does anyone out there know how to run Multitos from the Desktop, ie without
>putting it in the AUTO folder ?

You can't (so I've been told).

>I just want to be able to run TOS proggies in the background, I'm not
>bothered about multi-tasking GEM stuff (most of my GEM apps are too old and can't quite
cope with Multitos anyway). Would MINT be able to do what I
>want ? Or does it need to be run from/with a shell (eg Gulam) ?

MiNT would work fine for this. If you want to run TOS programs in a
window under GEM get TOSWIN. It works as an acc or prg and is
similar to/better than MINIWIN.APP that comes with MultiTOS.

>Thanks in advance for any help

Your welcome.

> Andy.

2423. Upgrades, Mega STe's and compatibility

Newsgroup: comp.sys.atari.st
Date: 1993-08-11 08:04:14 UTC
From: mkite@lincoln.gpsemi.com
Message-ID: <CBL533.KpC@bailgate.gpsemi.com>
Source record: 202800

Hi,

I was thinking about upgrading my STe (1 Mbyte) by adding more memory (2 - 4 Mb) and maybe TOS 2.06 and maybe even an ICD ADSpeed board. Anyone got anything to say about these "ideas" ?! (Like where to get 1Mb simms for a reasonable price at the moment ...)

Then again - can you still get hold of Mega STe's anywhere ? 'cos that way I'd get a decent keyboard as well (Don't want a monitor or HD 'cos I got them already). And if I did that - how much software compatibility would I loose ?

I guess some of these questions have been asked before but I wasn't looking for the answers then ! Answers by e-mail please to save on repeated information on the net - I'll summarize here and/or directly by e-mail if anyone's interested.

Thanks,

Martin

>I see constant references to MultiTOS in c.s.a.st. Is this all from Falcon
>folks, or is MultiTOS available for regular ST/STe machines? If so, from
>where?

I got MultiTOS back in June from HiSoft (UK). Seing as the UK is meant
to be so far behind in Atari stuff that should mean that you can get
it anywhere!

It works fine on my Mega STE, quite well (no bell) on my STE and badly
on my (sold) STFM. On the FM the bell bombs the system out. (Someone
tell me there's a new version :-)

Can someone tell me whether the MiNT with MTOS is a cut down version
of 1.04? There seem to be things missing (eg. fasttext and CTRL-ALT-Z
etc.)

I think it is about time I released the following article, which is
an update of my 2_5ram.zoo which has been around for a couple of years.
If someone would like to tell me how, then I will upload it to a.a.u.e
(a friend uploaded the first version for me)

========================= SNIP HERE ==========================

A 2.5MByte RAM Expansion for the Atari ST by Christopher Hicks
== (cmh@uk.ac.cam.eng)

==============================
Version 2.1 - 11th August 1993
==============================
This version copyright August 1993, Christopher Hicks.
Non-profit distribution permitted and encouraged.

Introduction
============
This document details the addition of an extra 2MBytes of RAM to
a standard 520/1040 STF/STFM. The motherboard I upgraded is
marked C070789-001 REV D (1040 STF), but this procedure should be
OK for other revisions, except that the IC numbers may be
different.

The existing RAM consisted of thirty-two 256K by 1 DRAMs, mounted
under the power supply. This procedure replaces sixteen of these
with two 1MByte SIPs, giving a total of 2.5MBytes.

Note that 1MByte SIMMs can be used instead - it's just that I
cannot get sockets for them at a reasonable price. The procedure
is identical, since the pinouts are compatible.

Disclaimer
==========
Although this procedure worked perfectly for me, I cannot
guarantee that anyone else can perform this upgrade without
damaging their computer. I therefore disclaim any responsibilty

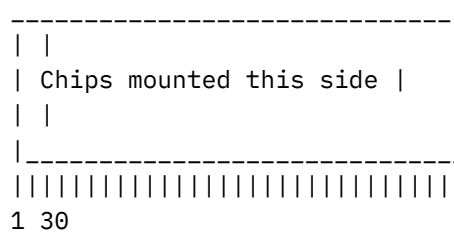
for any damage that may occur as a result of attempting this upgrade. It will also void any warranty on your computer.

On a more positive note, there is no reason why someone who is experienced in wielding a soldering iron, and has done some electronic construction/troubleshooting, should not be able to perform this upgrade successfully.

Summary
=======
The ST's memory management unit (MMU) can support two banks of RAM (upper and lower). These may each contain 512KBytes or 2MBytes. In addition the upper bank may be empty. This arrangement gives rise to the following memory configurations:

Lower Bank	Upper Bank	Total
1. 512 kB	---	512 kB
2. 512 kB	512 kB	1 MB
3. 2 MB	---	2 MB
4. 2 MB	512 kB	2.5 MB
5. 512 kB	2 MB	2.5 MB
6. 2 MB	2 MB	4 MB

This upgrade converts a machine from configuration 1 or 2 to configuration 5. An extra address line is required for the 2 MB bank. This is obtained from the MMU (U56) pin 64.



Device Pin Diagrams
===================

1. 256kbit DRAM
===============
```
------\_/------
A8 |1 16| GND
D |2 15| CAS
WE |3 14| Q
RAS |4 13| A6
A0 |5 12| A3
A2 |6 11| A4
A1 |7 10| A5
Vcc |8 9| A7
---------------
```

2. 1MByte SIP / SIMM
====================
```
1 Vcc 11 A4 21 WE
2 CAS 12 A5 22 GND
3 DQ0 13 DQ3 23 DQ6
4 A0 14 A6 24 NC
5 A1 15 A7 25 DQ7
6 DQ1 16 DQ4 26 Q8
```

7 A2 17 A8 27 RAS
8 A3 18 A9 28 CAS8
9 GND 19 NC 29 D8
10 DQ2 20 DQ5 30 Vcc

NB Pins 26, 28 and 29 refer to the ninth bit required for
IBM PC systems. This bit is not required on the ST upgrade.

Pin Functions
=============
A0 - A9 Address inputs (row/column multiplexed)
CAS Column address strobe
RAS Row address strobe
D Data input
Q Data output
DQ0 - DQ7 Data combined inputs/outputs
WE Write Enable input
Vcc Power (+5V)
GND Ground (0V)
NC Not connected

Parts Required
==============
1. Two 1M x 8, or 1M x 9 SIPs, 120ns or faster
2. Two 16 pin and two 14 pin IC sockets
3. A small piece of veroboard (big enough to mount the two SIPs)
4. A few dozen short bits of wire (a shredded scrap of ribbon
cable is ideal - lots of colours for easy identification!)
5. Two 0.1uF ceramic capacitors
6. One 33 ohm resistor

Total cost - about 60 pounds including VAT!

Precautions
===========
The motherboard and SIPs may be damaged by static electricity, so
don't work on this project wearing synthetic clothes and rubber
shoes on a nylon carpet etc... Seriously though, no damage
should occur if you are reasonably careful (use a grounded
soldering iron, and don't work on a highly waxed or polished
surface, for example).

Procedure
=========
1. Remove the motherboard from the computer, and identify the

RAM chips (U 3>6, 10>13, 18>25, 27>30, 34>37, 39>42, 44>47 on my 1040STF). On a 520 only half of these will be present, and step 2 may be skipped.

2. Desolder and remove the upper bank of DRAMs. These are scrap, so don't worry about damaging them, but do take care not to damage any tracks on the motherboard. On my 1040 these were the right-hand 16 chips (nearest the FDD), though I know that on some boards (marked REV 4 ?) it is the 16 nearest the rear of the computer. (The way to tell if you are unsure is that all the pin 4s of each bank are connected together, but the two banks are separate.)

When these DRAMs have been removed, the computer should work as a 520ST. If it doesn't, the safest recourse is to buy thirty-two 16-pin IC sockets, and sixteen 256k x 1 bit DRAMS. Remove all the DRAMS from the motherboard, and replace them with sockets. Then fit one of the new DRAMS in each of sixteen sockets, and move them until you find a combination that works. You then have a 512k lower bank, and an empty upper bank as required.

3. Mount the four IC sockets on the veroboard, end to end, and butted up together, so as to make two 30-pin SIP sockets. The connections on these will, from now on, be refered to as SIP1 pins 1 thru 30, and SIP2 pins 1 thru 30.

4. Break the veroboard tracks between the following pins on SIPs 1 and 2: 2,3,6,10,13,16,20,23,25,26. This operation separates the data and CAS lines on the two SIPs.

5. Connect together the following veroboard tracks: 28, 29, 30. This disables bit 8 if present, leaving bits 0>7 for the ST.

5a. Connect one of the 0.1uF capacitors between veroboard tracks 1 and 9, and the other between tracks 22 and 30. These are to decouple the power supply to the expansion board.

6. Decide where the expansion board is to go. Mine is in the space normally occupied by the TV modulator and associated circuitry. Bear in mind that leads to the board should be no more than about 3 inches long to avoid capacitance problems. It cannot be stressed enough how short these leads must be if the upgrade is going to work properly.

7. Back to the motherboard... Using a continuity tester you should find that the CAS lines (pin 15) of the removed DRAMs are connected together in two groups of eight. Take a short wire from one of these groups of pin 15s to SIP1 pin 2, and another from the other group of pin 15s to SIP2 pin 2.

8. Take wires from the pin 2s of the first group of eight DRAMs to pins 3, 6, 10, 13, 16, 20, 23, 25 on SIP1.

Similarly connect the pin 2s of the second group of DRAMs to
pins 3, 6, 10, 13, 16, 20, 23, 25 on SIP2.

The databus is now connected up, and the complicated bit is
over. Note that it is essential that CAS (pin 15) and D
(pin 2) of each DRAM are taken to the same SIP.

9. Now wire A0 > A8, WE, Vcc, GND and RAS from the SIP board to
the similarly named pin of any of the vacated DRAM slots.

10. Lastly wire pin 18 of the SIP board to pin 64 of the MMU
(U56 on my board), via the 33 ohm resistor (in series).
To aid identification, the part no of my MMU is C025912-38.
Pin numbers are marked on the board.

11. Make sure there are no shorts, and check all the
connections. Insulate the back of the SIP board (eg by
taping a piece of card over it) and insert the SIPs.
Also ensure that the resistor is well insulated.

12. Reassemble the computer and hey presto - a 2.5Meg ST. If you
experience problems with `snow' on the screen, this may be
alleviated in some cases by connecting a 68 ohm resistor in
series with each of the CAS and RAS lines.

13. Give a copy of this documentation to anyone you please, for
them to try the same upgrade.

14. When you run out of memory again, repeat exactly the same
procedure, replacing the other sixteen DRAMS, and you will
find that you have a 4 Meg ST - what could be simpler?

If you make use of this upgrade, please drop me a line at my
email address, and I will send you details of any other hardware
hacks I succeed with! Good luck...

Hi,

I have just uploaded a new version of MfsfM to ftp.uni-muenster.de.
It should appear there soon.
New features:
- installing from the AUTO folder
- various sorting methods
- file moving, copying and deleting
- creating symbolic and hard links

I also send a copy of it to ftp.uni-paderborn.de.

Marcus

>There were some carts bigger than 8K. I believe that Epyx' Winter Games
>was 16K.

Are you sure you're thinking of 2600 carts? I didn't think Epyx ever
did a 2600 game - although they did lots of 400/800 games, some of which
might have shown up as 7800 games. At least, there were no 2600 games
in the works and no 2600 programmers at Epyx the last time I did work
for them, which was just after Summer Games came out.

Epyx made 400/800 carts with 16K long before this. My own game, Gateway
to Apshai, was 16K.

>group...

>Here's the whole story:

>There are MANY different ST boards. ESPECIALLY 520s! This is why
>there are so many conflicting directions about upgrading being thrown
>around the net.

>Some have 16 (or 32 for a 1040) DRAM chips under the keyboard. On
>520s of this type, there are 16 free spots on the motherboard which
>you can fill with either 32k DRAM chips (and get one meg) or 64k DRAMS
>(and add a line from pin 64 of the MMU so it can address the > 1024k
>or memory and get a 1.5meg ST). Or you can replace ALL the chips with
>64k chips, add a line from the MMU and have a 2 meg ST... This could
>presumably be done with 128k chips and get the full 4 megs, too...

To the best of my knowledge there were never any 32k or 128k DRAM chips
made. Because of the way the addressing works they go up in factors
of four, ie 64k 256k 1M 4M 16M and now a very few experimental 64M.

Again to the best of my knowledge, all 520ST, STM, STFM computers
are fitted with either:
i) sixteen 256k x 1bit chips, or
ii) four 256k x 4bit chips.
In each case this gives 4MBits, or 512kBytes of memory, using 256kBit
chips in case (i), or 1MBit chips in case (ii).

>Some others have 4 (for 520s) or 8 (for 1040s) RAM chips under the
>power supply or on a daughter board. On these you need to either add
>4 more 128k DRAMS (on a 520 to get 1 meg), or replace all of them with
>256k (or even 512k) DRAMS and add the MMU line and get 2 or 4 megs.

Again you are confused about the chip sizes. These are 1Mbit and 4Mbit
chips respectively (NOT 128k, 256k or 512k).

>OR you can add a SIMM board! This can be done by hand (difficult...
>You have to remove your chips, get a daughterboard and some SIMM edge
>connectors, wire everything together) or by ordering a kit from a
>place like Toad (for $79 not including SIMMs) and do it without
>soldering.

>If you want to do things by hand, and have one of the STs with the
>memory in 32k DRAMS under the motherboard, get the text file,
>"2_5ram.zoo" in the Misc directory on atari.archive.umich.edu. Though
>it doesn't have any pictures (which would have been helpful), it will
>guide you through the process pretty well... I warn you, though, it's
>NOT easy unless you're pretty good with a soldering iron!

Well, I said "reasonably competent" with a soldering iron - just
depends what your standards are I guess. The chips you replace are,
in fact, 256kBit DRAMs. I have taken on board your request for
pictures, and will provide some when I get time.

>For my 1040STf (a Rev C board with the 32 chips) I opted to buy the
>SIMM board (because I got some free 1 meg SIMMs!) instead of having to
>desolder (no lie here) 512 spots and solder another 100 or so without
>error! I'm a bit shaky with the iron, see, and I really didn't want
>to waste my whole ST...

Since the chips you remove are scrap, the easiest way to remove them is
to snip all the legs close to the chip body with a fine pair of wire-
cutters. The chip body now falls on the floor (where it can stay!)
and the legs may be removed one by one. The number of connections you
have to make is nearer 50.

>That's it! Please, if there are any errors here or if you can add
>some more, post away! But don't flame! I'm just telling you all what
>I've found in my quest to upgrade my ST!

Hope this is helpful, and not too hot to handle! I have posted a
slightly updated version of my article as a followup to another item,
and can mail it to anybody who would like it.

2429. Ran MultiTOS yesterday - never again!

Newsgroup: comp.sys.atari.st
Date: 1993-08-11 10:12:56 UTC
From: thumpy@dcs.qmw.ac.uk
Message-ID: <CBLB1K.17A@dcs.qmw.ac.uk>
Source record: 202703

Hello,

I finally received MultiTOS from Atari UK yesterday (only 5 months after I got my Falcon...). I installed it and managed to get it to boot up OK once I'd removed the Satellite desk accessory that ships with Cubase. Cubase didn't work at all of course, but then trying to run two multitasking OS's at once is probably a bit ambitious. The real problem I had with it was the speed though - compared to the 16MHz 68020 Mac II running System 7.1 I'm typing this on right now, it's just hideous. Has anyone got experience of Geneva and MultiTOS? How do they compare? For now I'm just going back to plain old TOS - not too much of a hardship considering that Cubase is about the only thing I use the machine for at the moment. Does NVDI make MultiTOS useable?

As well as M'TOS the package I got from Atari also included details of their Doc Support stuff including Doc Support VI which is the Falcon Specific stuff and contains stuff about the Falcon XBIOS calls and the DSP, as well as a disk with DSP development tools on it. 49.95 UKpounds for that one. Does anybody know how this compares to the Hisoft DevPac 3 or Lattice C docs? Do the Hisoft packages contain any DSP tools?

Although I cannot comment on the validity of this particular rumour, I would like to point ou that ST Format is complete bollocks, and had a very poor record of accuracy.

Better UK mags are ST Applications (the best) and ST Review (the best of the `glossies'). Although both are still prone to falling for the odd bit of vapourware reporting.

Flopticals are very expensive in media terms for backing up data of any size,
remember that the original posting was talking about 240Mb drives. I would
recommend a tape streamer. I just bought one; it hangs of the same SCSI
adaptor as my hard-drive, and works well. I can also usr gtar and the tapes
to transfer software between my ST and Sun Unix systems.

2438. sample-sounds in GFA-BASIC?

Newsgroup: comp.sys.atari.st
Date: 1993-08-11 12:14:32 UTC
From: gero@uni-paderborn.de
Message-ID: <24anr8$gh4@news.uni-paderborn.de>
Source record: 202713

Hallo together ...

I'm looking for the non-plus-ultra-routine for digitized sounds. I'd like to use samples as music and / or effects in a game written in GFA-BASIC V3.5. The sounds come from a PC with SoundBlaster Pro card, they come in raw format, mono, 8 bit. The game should be able to run on any ST (it's not important that the routine is OK for MultiTOS), due to this the sampling-rate won't be higher than about 8 kHz to let the machine just a bit of performance. ;-)

My idea was an assembler-routine stored in an INLINE. It should get the adress and the length of the sample as a C-style parameter or something like that. But now the impossible thing of this -- it should run in the background. The routine has to link into an interrupt (don't ask me how to do that), play the sound and then un-link itself. It should be so clever to react secure on a re-call when the former sound isn't finished yet. Perhaps stop playing and play the new one or ignore the 2nd call and finish the first call. -- If the routine detects DMA-hardware, it may use it, but that's not necessary.

Does a routine like this exist? Who can write or has written something like that? I know it must be possible -- I've got a demo that plays a sample at 9.5 kHz in the background, and in the foreground an animation is running. How come I know what is bg and what is fg? Because you can interrupt that programme with a debugger and the sound plays on.

Please send your reply to me by mail because I don't have enough time to read all the news very often.

Thank you ...

>
>It apparently lets you do some sort of multiple session windowing
>thing when a host program is running on the UNIX side. Does anyone
>have more info on this? Where can my site get a copy of the UNIX
>host?

The host source files should also be available at wuarchive (since that's a mirror of atari.archive.umich.edu, and I think the source is there as well). I've actually seen at least 2 sets of source files, one of which had a larger number of files that needed dealt with. You might also check some PC archives as they may have the server as well (and probably some unix archives as well)...

To use unix windows to it's full extent, you need to compile the host server on your unix box (I'd imagine you could compile it on other things, but I dunno). When it's all compiled and ready to go, you run the main "uw" program on your unix side (assuming you're using UW.PRG on the ST side) and you will be within a unix windows session. You can then open multiple windows from that same login, and switch between the windows as often as you want.

Two things to keep in mind - first, your unix system obviously has to have the necessary resources/libraries/etc to compile the server - I was able to compile it with no problems when I was going to Pitt, but on the unix box here I couldn't get it compiled.

Secondly, in addition to the Atari version of Unix Windows terminal emulator, there are also versions for the PC (DOS and Windows-based) and the MAC. You use the same server for all three...

There is another option if you want to use multiple sessions within one login on a unix box. Posted recently to comp.sources.unix (I think) was source code for something called "SCREEN." With this, you only need to compile the server (it has a nice "configure" script which sets things up nicely). You then use *any* Vt100/ANSI emulator (such as ConNect, Uniterm, etc). You won't get the multiple windows *onscreen* but you will get up to 10 "windows" (sessions) open at any one time (if anyone's used the DOS version of Unix-windows, it's similar in this respect) switchable by a series of hotkeys. The end effect is the same as unix windows. And you can even cut-and-paste between the sessions.

Just thought ya might be curious to know...

>recommendations (other than getting lost)?

I would imagine that EDHAK 3.0 would probably suit your needs best.
It is an editor in general: it is a text editor, sector editor, memory
editor, etc. I haven't tried it on a Falcon, but maybe someone out
there has and can comment. It is an ACCessory, but if you're running
under MultiTOS, then you can probably run it as an application as well?
And it makes a great type-ahead buffer to boot :-)

From: csullogg@cc4.crl.aecl.ca
Message-ID: <11AUG93.09211092@cc4.crl.aecl.ca>
Source record: 202720

I used to use an ICD tape drive. Found it a real pain to retrieve
individual files. Now I have an 88 meg SyQuest that I use to
backup partitions on from my main drive. I use Cheetah (shareware)
to backup to the SyQuest. It moves data between drives at
13-14 megs per minute!!! Absolutely blindingly fast.

While Cheetah does not allow a lot of options for backups, the
dri
direct copy mode (whole partition to a folder on the destination
disk) is so fast that some other process would have to be a whole
lot better before I'd consider changing methods.

Message-ID: <1993Aug11.144413.5760@news.csuohio.edu>
Source record: 202726

Somewhere I remember reading that atari hard drives don't perform very well with one great big partition. Since MiNT doesn't allow you to mount filesystems wherever you want, the most logical thing to do is have a great big /usr fs, and a much smaller /etc or /bin with a symbolic link into the other (/bin/etc or /etc/bin). Dangers of huge partitions and icd utilities aside, would this slow the system down?

Jason

I'll go along with that ! Moreover, I seem to recall a claim in the
August issue saying that the _030_ will remain in the ST case.
Possible higher-spec machines may have decent casings, however.

|> Better UK mags are ST Applications (the best) and ST Review (the best of

True, true. Piper in ST Applications was rumour-mongering that the 030
will come with a new case design soon which facilitates a full 32 bit
bus (or whatever the 16bit thingy in the Falcon is that techies object
to so).

Doubtless Atari has a warehouse full of them ready for a big camaign
RSN :-)

Yes, Epyx did a few 2600 carts... I have Winter Games and it clearly says 'Epyx'
on the cart and manual. That's not to say that they didn't contract the
carts out to some other company, tho.

If you look at Craig Pell's 2600 cart list, you'll see two or three Epyx
games.

>make MultiTOS useable?

NVDI certainly helps. If you notice it's the AES rather than the VDI that is
slow. If you reduce the AES priority things improve quite a bit. The problem
is that any app you then run gets the AES priority by default, so you have
to set it manually back to 0.

2459. Info on Zmodem 90

Newsgroup: comp.sys.atari.st
Date: 1993-08-11 17:30:21 UTC
From: gt1448b@prism.gatech.EDU
Message-ID: <108363@hydra.gatech.EDU>
Source record: 202735

Someone recently kvetching about Flash II e-mailed me that Flash II didn't use the newest Zmodem 90 protocol and Kermit with long packets and sliding windows. I e-mailed Missionware to see if they were interested in adding these features to Flash II. They definitely were interested! I know that the Kermit protocol, including long packets and sliding windows, is documented in a book by Frank de Cruz published by Digital Press. What I don't know is where this Zmodem 90 protocol is documented. I'll pass along any information about this I receive.

BTW, is there a newsgroup dealing specifically with the Zmodem protocol?

Thanks in advance.

There are just programs that do that. If you like it or not.
What I posted this message for was: there are certain program's which enable you to have accessories in a seperate directory. I've never used one but I'm 100% sure they (well, at least one) exists. (Maybe a message in this newsgroup would work?)

Greetings, Tim

>to Apshai, was 16K.

Yes, I am sure. Epyx did several 2600 carts in 1987-1988. Those carts
were done for Atari, and marketed by Atari.

I worked as an employee for Epyx from November 1983-Feb 1987, and again
from November 1988-November 1990. You were never an employee at Epyx
during the time I was there, but I can certainly believe that you did
contract work for them around 1984. Actually, all but two of the
programmers at Epyx in 1984 were originally 2600 programmers (Epyx
merged with StarPath in November 1983), but Epyx was not doing any 2600
titles at that time. Epyx resurrected the old StarPath 2600
development systems for the Atari work.

Well, at least on the early 2600's (pre-1980), hues $e0-$ef and $f0-$ff
were generally the same as the hues $10-$1f and $20-$2f. The exact hues
changed several times over the years.

>P.S. Don't try and send me E-mail at the moment 'cos my mail system is a
> little broken at the moment, so I'm not sure it will work yet !!!!

Andy, Don't confuse e-mail and ftp as they are two different animals.
To connect to an ftp (File Transfer Protocol) server you will need to
have an ftp program at your end. Once you had that program installed then
you would be able to say the following;

ftp machine.domain.site.country

after which a coonection would be established (after a short delay) and you
would be prompted for a USER ID (login:) and following that a password:
It is acceptable to log in as USER:anonymous, what I mean to say is there
will be a prompt of some kind to which you should enter an ID of;

prompt: anonymous

after which you will be prompted for a password to which you should type your
local system ID, for instance in my own case I would type

password: jt@physiol.su.oz.au

although you should be prepared for the fact that you will not see your password
echoed on the screen for the obvious security reasons. You will then be logged
on to a remote server. Now you need to to know some of the ftp programs
commands. To get a file you should say

prompt:get filename

and the machine will then begin serving you the file. If you want to change
directory, simply use the command: cd directoryname. To get many files you
can say

prompt: mget file*

usually you can also type a ? at the prompt and get a list of commands. You should also be aware of the differance between an ASCII and a BINARY exchange. If you are exchanging text files then you will get away most of them time exchanging using ASCII mode (default) but if you are going to import programs you should be in binary mode. To do this, after logging in type the word

prompt: binary

at the command line and the program will switch to binary exchange mode.

As you can see, this is nothing like driving e-mail. It is possible that you are working on a system where there is a system administrator, and you should speak to him/her before going merrily on your way as some people may not approve of the idea of you ftp'ing all over the globe (ie: this costs money).
If you are operating from home, then you need to realise that your phone bills are going to be high as some of these exchanges over a slow modem will be very long.

Happy sailing,

JT

If your so tired of Atari, why do you keep reading this
newsgroup and posting? Why dont you just go away? Ive never seen
any posting by you thats positive.
Perhaps, I dunno, just perhaps, has it sunk into your skull,
that maybe MAYBE we own Ataris just because we like them?
In the past, youve flamed Atari for this or that, but
do you do anything about it?

Yeah, I seem to remember reading way back in '88 or so that Namco
actually bought AtariGames...but I guess that was false.

BTW, what is Pacman '88? I've seen it in the KLOV... it was released
around the same time PacMania was but I've only seen Pacmania not Pacman '88..

>from November 1988-November 1990. You were never an employee at Epyx
>during the time I was there, but I can certainly believe that you did
>contract work for them around 1984.

I was part of the Connelley Group, which consisted of the original
Epyx software group (minus one or two folks, notably Randy). We broke
off from Epyx proper around 1982, but continued to do contract work
for them through 1984 or so.

>Actually, all but two of the programmers at Epyx in 1984 were originally
>2600 programmers (Epyx merged with StarPath in November 1983)

I'd forgotten that. Makes a lot of sense, then.

I have a routine that I use in GFA Basic that came with ST REplay PRO ... unfortunately it's not the fastest routine in the world, but you have a comfortable amount of processor time left playing back samples at 8khz... (naturally it does run in the background) Since I don't have FTP access I can UUEncode it and send it up to comp.binaries.atari.st if you like...

From everything that was posted back when Atari UK made a big deal about their "reintroducing" the 520ST, it sounded like they intended the units to be sold as games machines, not general purpose computers...

If that's the case, memory and hard drives aren't really necessary.

(I still think they just found a dusty warehouse with a bunch of old, obsolete STs in it...)

BobR

This is precisely what I've done, and no, it doesn't slow the system down.

I've included below the way I do it myself (my mint.cnf file)

>
> Jason

As you can see I use my F: drive as if it were my root partition and use symlinks like mountpoints, this includes on the drive itself so as to link in other drives for such things as /usr/local etc. That's why it's best to base your system around a minix partition.

Nice if you have a SCSI disk, but if you have an original Atari
Megafile 60 like me you will still have to wait for the not yet ready
ACSI adaptor. And yes I know, the thing is too slow for the falcon etc.
etc. but not all of us have large amounts of money. By the way the
megafile 60 rates an average access time of 53 ms and a data rate of
552 K/S. Is that normal or what?

Erlend.

I guess the reason why memfile will not work is that it uses line-a to
speed its graphicsoutput.The editor I use for diskediting is XXED1.1. I
have had it for quite some time now and besides the slow search speed
it is really good.

Source record: 202687

uw ...

I have been using uw ever since I found it some years ago.

when I had a 2400bps modem, I'd do my schoolwork editing by making a large font window that was like 80x6 or so-- as it made for quick refreshes in emacs.

UW has problems. first of all, the multiplexing is a bit crude. I wish it had a much "finer" control. If you've ever been in irc before the days of flood protection, once you were flooded in a window, you couldn't break out of it. There were times I simply had to hang up. Also, the UW server doesn't seem to handle HUP or disconnect signals very well.

adm31 terminal emulation is the pits.

I get in and run SCREEN in one of my windows just so I can use vt100.

the kermit downloading in a window is a JOKE for any file > 10K. I'd rather disconnect and use zmodem where I get > ~1250cps throughput.

one REALLY nice thing to do is to run UW on a mono monitor (ie: no mono emulation... it does work under mono emulation, but it's nasty) with BIGSCREEN....

Aahh, but there are ways to FTP using E-mail.. I'm not quite sure how, though.
There was an article about this in STUser or STFormat a year or so ago.
Try and find the issue and check it out..:)

2490. No more Low TOS support...

Newsgroup: comp.sys.atari.st
Date: 1993-08-12 09:59:06 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <24d49aINNsu@golem.wcc.govt.nz>
Source record: 202670
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

From some of the stuff that I have been reading on GEnie, Atari is no longer supporting the lower TOSes, they stated only current TOSes are supported,,?

I suppose this means only 2.06 and above..

One of these was in responce to problems with Works and TOS 1.2, but found to be a bug in using Lattic C, the other is the problems with the install program in SpeedoGDOS, could this also be this same Lattic C Bug..??

Also the Speedo ACC's don't work on the old TOSes, ie, the drivers.acc and outline.acc...

So you chaps with old TOSes now is the time to upgrade, the best way for old machines is to get TOS 2.06 but also use TOS 1.4 in 2 chip versions as the back up TOS, Please don't use TOS 1.0/1.2 as Back up...

also I have found the cheapest place to get TOS 2.06 UK version
is CodeHead, they have French/UK and USA versions for $60us...

They also sell the TEC board..

Can some one tell me more about the Newell Indust board, does it support switching Roms..?? also a address for Newell would be of help...

Thanks.....

Roger..... sheppard_r@kosmos.wcc.govt.nz

2494. Re: minix partition sizes

Newsgroup: comp.sys.atari.st
Date: 1993-08-12 10:10:56 UTC
From: scott@sfi.santafe.edu
Message-ID: <SCOTT.93Aug12101056@sfi.santafe.edu>
Source record: 202690

well, I purchases minix 1.1 and I never did get any of the upgrade paths to 1.5.10 (1.5.x) to work. minix also trashed my hard drive more than once. minix did not handle bad sectors-- so I started an uncompress on my st under minix (big mistake) and I got a write error after 2 minutes.... the uncompress would not break (^C) and it took over an hour for it to finish-- but the output file was corrupted. After that, resorted to uncompressing on a sparc and sneaker-netting floppies to my st.

I talked to one guy on here (I think he was from france) about minix-- but he didn't have time to help me and the net-- I understood that. I talked to someone else (howard chu?) about upgrade packages-- but I just gave up.

I'm personally going to shoot for a sun4 (ipc) so I won't have to fiddle with no support. It would be great to see linux on the ST, but I fear I'm dreaming-- and no, I will NOT do the port myself. Sorry.

As far as support-- I gave up ever hoping to release a bunce of small games on the ST when I got my STOS system going (stos, compiler, maestro, etc). and then upgrade to 2.04 (I thinkm or was it 2.05 or 06 ... whatever) broke the compiler.

now, my ST is a uw terminal. my disk drive just failed-- so I can't even play chess master.

Does the fabled falcon dredge up the question of support?

Two quote Homey ``I don't think so'' ...

Scott

2495. TOS.IMG file format.

If you don't have direct Internet access you have to use mail-servers...
Try to send the word 'help' in the body of your mail to a ftp-mailserver.
Perhaps you want to test
ftpmail@decwrl.dec.com (general ftp)
mail-server@ftp.tu-clausthal.de (only our local ftp-site)

Bye,
Wolfgang.

I hate to agree with Bob...

But my guess would be they are selling all the units they exchanged
in their repair program. (you know you send them your broken machine
and six months later they send you a replacement :)

Message-ID: <24df08INN1jr1@rs1.rrz.Uni-Koeln.DE>
Source record: 202677

Hi folks,

in our DTP department, we have an Agfa PCR II film recorder. This thing has an SCSI interface and GPIB interface. We'd like to know if any drivers for outputting on such a film recorder are available. We are especially interested in drivers for Calamus and GDOS. However, any program that takes a variety of input formats (e.g. PostScript, TIFF, CRG, ...) and outputs it on the film recorder would be very much appreciated. Pointers to commercial software are welcome, even if the program is expensive.

I would second this rating on the Xtra ram upgrade. I made the mistake
of buying one and installing it. I was one of the lucky ones. my
upgrade works (for now) but I know that when it fails, I be in for
a expensive repair bill (replacing the mmu socket). I am half tempted
to take my upgrade back and demand that they fix the dammage it caused.

: I'm reading interested the discussion about mpeg on atari and now it is time to grin
: about this :-) because in the moment i'm working on a sparc2 at siemens and i'm
: programming at an mpeg-player. the speed on the sparc2 (26mips) is incredible slow (8bit
: colours) and on the sparc10 (86!mips) a gray-dithered videosequence (8bit gray) will
: decode approximately 3.5 pictures per second. look this is for realtime applications too
: slow and won't be much better in the next times. Maybe the jaguar will deal with it
: (150mips).
: mike :-)
:

--
It seems to me you coul'd be a little faster :-) I got at least 10
pictures/sec on my 486dx2/66 with Linux when I compile the free Berkeley
code in grey-scaled mode...
Btw, we (Brainstorm) showed at the Cebit93 our Falcon MPEG viewer running
at 13-16 frames/sec (depending on screen resolution) on I-frames only
sequences. It uses the DSP of course, just like our JPEG library (wich
decodes a 320x200 in about 0.5sec). This JPEG library can be obtained from
Atari for around 100$, this prices lets you use and distribute it with all
the software you sell. A (soon) future version of Gemview will use it, but
the driver will not be included with it, sorry.

For more infos about our MPEG/JPEG products, please just email me at
laurent@brasil.frmug.fr.net.

2508. Hp Deskjet & print spoolers/queues/buffers don't work

Newsgroup: comp.sys.atari.st
Date: 1993-08-12 13:57:33 UTC
From: selick@csa.bu.edu
Message-ID: <24di8d$omh@news.bu.edu>
Source record: 202680

Thanks to all who helped me get my deskjet online. I vid finally modify my cable with a transistor on pin 1 & ground, and it works great. Now, the question is, how can I get it to work with a print buffer, spooler, or queue? I am mainly looking for something that will let the computer work on the next few lines while the printer is printing to speed up the output some. I have tried everything I could find at a.a, as well as the Neoqueue found with neodesk 3.1 (whatever the latest version is). Most of them just hang up, others print garbage & formfeeds. I tried them with Pagestream, Notator, Calamus, and Uniterm screen dumps to no avail. Has anybody on the net found a combination that works with the deskjet?

Thanks,
Steve

The only problem is that Cheetah has some rather serious bugs. I personally use Diamond Edge with my Syquest 44. Partition to partition image copies are incredibly fast, and seem to be rock solid. The Syquest is definitely the cream of the crop with backups (a bit expensive to devote cartridges for this, but peace of mind is priceless :-).

Source record: 202688

Well the latest issue of ST Format says that the real reason that the Falcon hadn't appeared in big quantaties was because of the companies in Taiwan. It mentions that the first two batches of Falcons failed the quality control tests then says:

"Since Atari are so determined to produce quality products, unlike at least one of their competitors [I wonder who they could possibly be talking about!?!??!], they could not conceive of allowing these machines to go out. This was a bit of a mistake as it turned out, since it later transpired that it was actually the quality control equipment that was faulty."

ST Format do actually have the courage to be critical of Atari in a couple of other parts of this issue though. Perhaps for the first time for a couple of months?!?!

From: Chris_Clee@redact.uucp
Message-ID: <Chris_Clee-120893161315@89.32.34.5>
Source record: 202576

My problem: I want to connect a high-resolution, monochrome monitor to my Atari 1040 STFM that I've just bought second hand, but I don't want to pay the over-inflated prices being asked by the dealers.

Does anybody know whether you can connect a regular monochrome monitor (e.g. from a PC) to the Atari's monitor port ? If so, how ? Are there any pitfalls to watch out for ?

Any help/suggestions greatly appreciated.

Cheers,

Chris.

Try Multidesk Deluxe from CodeHead Technologies. It lets you keep your
.ACC files in a separate directory. Has lots of other nice features, too.

2519. BIG system for SALE

Newsgroup: comp.sys.atari.st
Date: 1993-08-12 16:44:35 UTC
From: krakoverj@immunex.com
Message-ID: <1993Aug12.084436.100@immunex.com>
Source record: 202691

Thinking of selling my system, I really do like it, however I don't use
it much, since we have much better computers at work.

Anyhow, If I get an offer I like, off it goes....

What I have----

Mega ST4
30 Meg + 60 Meg drives enclosed in shoebox case w/ ICD adaptor
30 Megafile Drive
Multisync monitor (OMNI)
Spectre GCR w/roms and 3.0 software
LM804 Laser Printer
SX212 1200 Baud modem (atari)
16Mhz accelerator card w/FPU (not installed)
9-pin printer (Panasonic)
SyncoExpress (disk copier)

Software------
I have over 100 original disks consisting of mostly games
I have over 100 shareware disks mostly from Start

If you have any questions, please drop me an E-mail

Thanks,
Jonathan

2520. Atari TOS INFO request!

Newsgroup: comp.sys.atari.st
Date: 1993-08-12 16:44:53 UTC
From: mcookson@flute.calpoly.edu
Message-ID: <1993Aug12.164453.109538@zeus.calpoly.edu>
Source record: 202692

Can someone reply (email pref, I will print the results if anyone cares):

What is the "best" version of TOS you can get on ROM for the ST?

I am using 1.4. However, on disk I have 2.0, which is much better. I also have "3.0" (although I have no way to tell if this is really 3.0: TOS 2.0 says so in the info, 3.0 does not). Anyhow 3.0 is in German, making it a little less convienient.

Are these versions available on ROM? I am also using NeoDesk, but I would like to have the improved Atari stuff.

Comments on Multi-Tos would also be appreciated (is Multi-TOS available as a ROM based product? Is it incorporated in TOS 2.0x?

One last comment: if you know, also let me know the best (newest) ROMS for the TT, STE, and Megas (if there are ROMS that work only on these).

Thanks. Email to : mcookson@flute.calpoly.edu. I will post a summary here!

- mike

2521. Atari ST or STe wanted

Newsgroup: comp.sys.atari.st
Date: 1993-08-12 19:02:35 UTC
From: axc@po.CWRU.Edu
Message-ID: <24e44b$puc@usenet.INS.CWRU.Edu>

>to be a bug in using Lattic C, the other is the problems with the install
>program in SpeedoGDOS, could this also be this same Lattic C Bug..??

As the current maintainer of Lattice C I am not aware of *ANY* problems
which:

A) stop the product from being used on TOS 1.00 or 1.02
B) stop products built with it from being used on these OS's

>Also the Speedo ACC's don't work on the old TOSes, ie, the drivers.acc and
>outline.acc...

Because of a BUG in ATARI's code; they do a wind_update(END_UPDATE) first
time around the evnt_multi() loop in the install program & in the DAs, before
they own the semaphore (which hangs on 1.00/1.02).

Mad? Yes I'm mad, in fact livid that this slander is about...

Actually, it was incomplete. Namco bought Atari OPERATIONS, the
arcade-chain part of Atari. Namco is reasonably big as an operator in
japan, with some 60 odd percent of their business there being
operations.

Message-ID: <1993Aug12.220406.19180@prime.mdata.fi>
Source record: 202555

A question to all STe-owners with 1MB or more memory: did you already run across this absolutely great game Utopos? And if you did, what did you think of it? I for one registered immediately, and got my registered version yesterday.

For those who don't know what Utopos is, it is a 2-player game where you and your friend control each space ship (like in Oids or thrust) and try to blow each other away. The screen is divided in two horizontally, and the play-area is quite big. And it has a great soundtracker tune playing in the background. IMO, everybody with a STe and 1MB memory should definitively own this game, it can be found at least at atari.archive.umich.edu in the Ste/ -directory, by the name utopos.lzh.

Message-ID: <1993Aug12.222846.129087@zeus.calpoly.edu>
Source record: 202557

You would have to check on each individual board, but . . .

The Atari uses 8 bits in each memory chip (like the mac). The IBM uses 9 (one for parity). The boards I have seen you can use EITHER set of sims in, because the 9th bit is simply ignored if it is not needed.

But, as you have MAC sims, you should be fine regardless, since I cant imagine that they would build a board that REQUIRED 9 bits, unless they do their own parity checking, which seems very unlikely!

I am going to buy one today. If I find that you can not use both types of simms I will post again. But usually a sim slot that asks for an 8 bit sim can use an 8 or 9 bit sim.

>ATARI ST format (maybe with MiNTlibs)?
>

I recently installed GCC 2.4.2 as a cross compiler on a DECstation and
it has been working fine. I currently can only compile C code, and not
C++ or Objective-C code, but it does work and the binaries can be downloaded
to an ST and run.

The process I went through was something like this:

1) I found a copy of gcc-2.4.2.tar.gz (GNU zipped version of the GCC 2.4.2
distribution) on a site using archie.

2) I got that, along with the file gcc-242s.diff from atari.archive and
followed the instruction in the README.TOS file there. It is important to
use Bammi's makefile and not use the configure utility that comes with
the normal distribution.

3) After that was done, i had the compilers (gcc g++ cc1 cc1plus cc1obj cpp
cccp) done.

4) I then found gas-1.38.1.tar.gz from prep.ai.mit.edu in pub/gnu and
fixed that up using the patches found on atari.archive. I forget the
exact name of the file, but it contains some makefiles, a diff relative
to the gnu distribution, and (i think) some c source files.

On the DEC I had to fix a few things, such as a few syntax errors in the
.c code... so don't let any errors deter you from finishing it up! :)

5) The final step is to port gnu-ld and get a cross-nm (named cnm) and a
cross-ar (car) up and running. Just get utlsrc36.zoo from atari.archive
and literally follow the instructions for making versions for cross-compilers.

I nearly forgot.. you will need to get incl93.zoo from atari.archive in
Gnustuff/Tos/Include so you can finish steps 3-5. You'll have to install
that in your cross-compiler's include directory which $CROSSDIR/include in
the makefiles...

I hope this helps. :) And if it works, I'd love to hear about how it came
out!

J>Yes.. Iv'e noticed that to. But not always. Most of the times it
J>happens there is folders included in the file..

Probably you're using an older version. The newest version is 2.22
(28 july 1993).

Anyway the message 'Damaged file. Skipped' means that LHarc has found a
damaged file in the archive which was automatically skipped. Older versions
(<=2.01) stopped processing in that case. The message 'Garbage found at the
end of the archive' means that there are some/many senseless bytes. Sometimes
this is caused by destructed archives but in most cases you can ignore this
message as the problem is caused by stupid transfer utilities (Xmodem, Ymodem
etc)

Hey everybody,

Last night I got a newsletter from Darek Mihoka. Apparently version 3.0 of the gemulator will now support sound for those with a sound-blaster or Adlib card. Also he now supports 800x600 resolution in both monochrome and color. And if that wasn't enough, he now has built in support for the magic sac (a footnote in the newsletter mentioned that spectre support was not included at the request of David Small, major bummer :( ).

BTW, his Atari 8-bit emulator is included and will now run with the Gemulator.

Now if we could just convince David Small.....

2538. WANTED: HD for Atari ST

Newsgroup: comp.sys.atari.st
Date: 1993-08-13 02:02:10 UTC
From: rjm@world.std.com
Message-ID: <CBoDnn.M7w@world.std.com>
Source record: 202563

I would like to have a hard disk for my Atari ST. I prefer to use SCSI,
but will bid on other types if they are already configured for the Atari.
At this point I can use my ST without a HD, so adding one will basically
be better than the occasional floppy when saving MIDI sequence data.

For sale:

USR Courier External Dual Standard 16.8 w/fax

Brand new - taken out of the box once, used maybe one week...

This modem is in spectacular condition!

$450 COD cash - you pay the shipping if other than standard UPS ground.

This price includes all original manuals, diskettes, box, PS, phone cord, etc.
I also have the $99 trade-in certificate sent to me from USR.

It has not been used on a BBS, if that matters...

I need a Telebit Worldblazer - that's the ONLY reason why I'm selling it, as I
can't afford to buy the WB until I sell this modem...

Jason Buchanan
jsb@dswhq.omahug.org
1:286/1@fidonet.org too...

Hello,
I really really really want to buy a 1040 STE, so I am selling my 1040 STF, plusplenty of software (mostly games). I will accept the best offer (shipping and handling is included with your offer) so e-mail me at tim@rider.cactus.org.
I am also selling some games, just in case someone just wants games and not the computer. The games I am selling are:
Shadow of the Beast II
Pacific Islands
Buggy Boy
Ikari Warriors
Battleship
Bratacus
Stationfall
Space Quest (first one)
plus a few more. Again, I am selling these to the best offer. Thanks.

series...
SD>
Steve,
I have got a Floptical running on my STFM and I am pretty
pleased
with it. It is running of my old ADSCSI Plus adapter (allthough I have had it
running off an ADSCSI Micro). The only problem I have found is that the normal
ICD utilities don't work with it (up to 6.08) but I bought the Pro set and I
it
works well with that software!

Nope.. Ash is the new Bourne shell for BSD 4.4 which contains no AT&T code.
The original version of this shell didn't support the "for i do...done" loop
construct, my modified version does.

: sequence using the DSP. The demo is by Brainstorm, France (don't know their
: full adress). And FACT IS: IT DOES AT LEAST 15 FRAMES per second!

You should'nt have it :-)
Are you sure it's the MPEG one ? We released some demos of our FLI decoder
with the famous bird, but never any Mpeg demos, because this work was
intended to be sold, even if it isn't yet :-(
But you're right anyway: 15 frames in grey-scaled / 16 colors falcon screen
is the rate for the MPEG birdy sequence. It's a little slower (about 12) in
True color for example, mostly because the Falcon itself is a little slower
in such a resolution.

Message-ID: <24g3ag$ijr@fbi-news.informatik.uni-dortmund.de>
Source record: 202580

Hi,

GEM-View 2.40 is avaiable!
New Features:
o loads Kodak Photo CD
o using the DSP-JPEG-Decoder (written by Brainstorm) if installed
o quick 90 degree rotation (90,270 up to 266666 Pixel/sec, mono, ST 8MHz)
(180 faster ;-)
o online rotation
o online brighten
o bug killed

A test between loading time using DSP-JPEG and MC68030/16 follows!

NO UPLOAD at the moment!

Dieter Fiebelkorn

2556. WANTED: Atari MEGA STe or STe in good working condition

Newsgroup: comp.sys.atari.st
Date: 1993-08-13 13:10:54 UTC
From: lancer@ramanujan.WPI.EDU

Source record: 202581

***** ATARI 520ST FOR SALE ******

I am selling my 520ST with all manuals SW, old ST magaizines etc. The machine has TOS in ROM installed, 512K of memory, 1 low density floppy drive, keyboard/CPU, mouse and monitor and it still works.

It's great for a simple, cheap terminal, (I have ST Temp SW which works well) or a specialized stand alone system. If you're a Radio Control Model Airplane buff you can get a great RC trainer/simulator which will run on the machine.

If you're interested, I'm selling it real cheap. You can reach me at:

sklar@meglos.mdcorp.ksc.nasa.gov

or call me at home in Orlando, 407-384-7062 for info.

Mike Sklar

>and were is there support for Atari these days...
>

Well thats not very true. Since the 1040STE (1MB) is only US$420, I
would have to question spending too much trying to upgrade a 520STFM.
BUt to say that it cant be done is a very bad interpretation of reality.

Just last night I put 4 MB of memory in my 520STFM.. (I had already
put 1 MB in, which will go right on the motherboard - no expansion card
needed). I had to put a card in to get to 4MB, but it gave me SIM
slots, which is a alot nicer, as I can use my spare MAC and IBM simms on
the board. I bought the JRI expansion, so I also got a 4096 colour
palette (I am not sure if anything can use it -> probably not, but it
was only a few bucks extra for a shifter chip)_.

In any case, i bout by 520stfm about 5 years ago for $399 or
somenthing. Il not sure how much UKL149 is, but presumeable thats about
$200 to $250 ?? If it is over $200 you would be getter advised to just
grap a 1040STE, as the expansion (and TOS expansion) will end up costing
more than the STE ($90 for memory expansion board, maybe $140 for TOS
2.06 and bridge board for that).

While that makes the group inclusive to the various hardware models, it makes it exclusive to one operating system. Then people would want to form new groups for Minix, OS/9, Geneva, etc.

With the small amount of traffic that these groups recieve, I don't see much reason to split them further (it would just mean I'd have to subscribe to a larger number of groups with a smaller number of topics: I'm interested in things related to the Falcon even though I don't own one. I suspect Falcon owners also still have interest in ST issues...)

Whatever,

2564. Re: Info on Zmodem 90

Newsgroup: comp.sys.atari.st
Date: 1993-08-13 17:32:04 UTC
From: vpm3q@poe.acc.Virginia.EDU
Message-ID: <CBpKpH.Dv5@murdoch.acc.Virginia.EDU>
Source record: 202590

I believe that Zmodem90 is a reference to Omen Technology's proprietary updates to the Zmodem protocol that they originally created and put into the public domain. If you want to support it (I have no idea what these new features are!), then you have to pay them money. If anyone has a Mac and uses Zterm, then this is explained better and in more detail in some of the documentation. I have had no problems using Alan Hamilton's Zmodem ttp with Uniterm on Delphi and here at UVA (other than tweaking), though, so maybe the extra features aren't vital, just nice to have?

MiNT 1.08 is released on the 12. Aug. 93, without big anouncement
and only a small notice by Eric. It is available in Germany since
last night, i got it 2 hours ago and will compile it tonight.

The copying conditions are still the same.

2571. Looking for high-speed modem...

Newsgroup: comp.sys.atari.st
Date: 1993-08-13 21:30:09 UTC
From: den@abacus.hgs.se
Message-ID: <DEN.93Aug13233009@abacus.hgs.se>
Source record: 202596

Since my current modem didn't survive the last thunderstorm I'm now looking for a high speed modem (preferrably a USR DS 16k8 or a ZyXEL U-1496EPlus). Can someone please give me some hints on where to get these as cheap as possible (doesn't really matter from what country I have to buy it as long as the company accept VISA-cards :-).

Anyone got a cheap source of high speed modems? Drop me a note at den@hgs.se, or call me at +46 26 72905.

Thanks in advance,
Daniel Eriksson.

>etc. but not all of us have large amounts of money. By the way the
>megafile 60 rates an average access time of 53 ms and a data rate of 552
>K/S. Is that normal or what?

Maybe - Atari used at least three types of drives in there:

A 61 MB Miniscribe drive in the early units - about 60 ms. No label.
A 65 MB Microscience drive in a few units - about 24 ms. Labelled MCSxxxx.
A 63 MB Seagate drive in most of them - about 28 ms. Labelled SEAxxxx.

The Seagate drive tends to become slower with age.

bye, Peter

2574. Hard disk crash; why can't I re-format?

Newsgroup: comp.sys.atari.st
Date: 1993-08-13 21:42:16 UTC
From: root@hacktic.nl
Message-ID: <24h1s6INN1s4@xs4all.hacktic.nl>
Source record: 202611

Hi, My Megafile 30 wouldn't start up twice, and the second time
I banged it so hard that I think I did some damage:
the drive WOULD start up, but only a few files were still readable.

So I tried a reformat. Something went wrong there, so I thought the
crash was real bad.

The strange thing is that from that moment on, HDX and the other
AHDI utils could not find the unit anymore. I have two drives,
and the 2nd (Unit 1) used to be selectable, but it isn't anymore.

Now I'm thinking of replacing the drive. So I swapped my OK drive
from the Megafile 20 into the Megafile 30 to see if that would work,
but the problem remained: the drive is not visible to the AHDI utilities.

The broken drive didn't work in the Megafile 20 case, either.

So, do you think that something's wrong with the RLL controller or
the power supply?
Can a crashed disk theoretically damage the controller?
Do you have any hints to make the drive visible again?
Might other formatting software (like the ICD stuff) help?

Thanks if you can help me.
Bye,

The problem was definitely not a bug in Lattice C, it was a bug in some
libraries that Atari was using internally. Perhaps someone confused those
(Atari produced) libraries with the Lattice library. The Lattice library
and compiler were definitely *not* at fault.

As for support of older TOSes; we probably will drop support for TOS 1.0
and TOS 1.2 at some time, but so far as I know that time has not yet
come. I would strongly urge people to upgrade to at least TOS 1.4 now,
though (TOS 2.06 would be even better, obviously).

>As the current maintainer of Lattice C I am not aware of *ANY* problems
>which:

Ah, the current maintainer!

I've got a (free) copy of Lattice C here, given to me by David Link on CeBit '92. I intended to implement my fine window library WinDial for it, but never got very far due to compiler problems. The version I have now is 5.52, is there a newer version, and where do I get serious support now (I used to contact a guy at CCD, Germany, he did his best, but my problems were just too sophisticated, I think :-)

Thanks for answering - Peter

> I saw several copies of MultiTOS for sale at the show
>

Hmmm. I've seen MultiTos running on an ST and an STE. In fact, the package lies. It says you need 2M to run MTOS when it can be run in 1M. You only have ~128K left...but it runs.

The speed is quite what I'd expect. I think it's more responsive than Sys 7 is on a 68000.

I shouldn't comment on Geneva. I didn't spend that much time watching it... but I wasn't to impressed with what I saw. If I spent more time with it maybe I'd change my mind. For now it's only a beta version, that only multitasks Gem programs, has no desktop (unless you get the beta NewDesk 4.0), and is more expensive than MTOS. Oh, I guess it multi-tasks TOS programs..but it needs MiNT (which is not included) to do so...and they claim great speed increases "due to not needing to load MiNT". I really couldn't tell any speed increases. But then, they were running it on a TT and at the time I'd only seen MTOS on a ST's. It looked faster...but I expected it to be so. I never did catch wether it was preemptive multi-tasking or if it was cooperative.

Like I said..if I spent more time with it I might have changed my mind...but all in all my opinon of it was "why bother?". Part of my low could be the market-droid guy demo-ing stuff. Blech!

I don't know the ST or Spectre GCR that well, as I am an Amiga user and
also the AMaxII Mac emulator (similar to the GCR, except the Mac floppy
isn't emulated as exactly 800K drive). I have good luck with HPDJ 2.1 and
3.1 (3.0 is buggy) on my system, which I have a DeskJet Plus. I know
HPDJ can print to a HP LaserJet as well, but I don't know about other
LaserJet/PCL compatible printers such as yours. There are commercial
drivers for many laser printers on the market: JetLinkExpress (which
I have got recently, but not much experienced yet.) and PowerPrint,
(which was MacPrint.), you may want to try them. I am not aware of
any freeware drivers yet.

2584. Looking for CLI Command Shell...

Newsgroup: comp.sys.atari.st
Date: 1993-08-14 08:49:04 UTC
From: john@albemuth.equinox.gen.nz
Message-ID: <H.eg.bqKHZ6ikNCk@albemuth.equinox.gen.nz>
Source record: 202609

Hi There,

I'm on the look out for a PD/Shareware/Freeware CLI Command Shell.
Particularly I would like to find a UNIX like shell that will run well
on a 1 Meg, dual floppy only system (must have most commands builtin)
but that doesn't take up too much memory or disk space. Something which
understands the later developments in TOS would be useful also (i.e.
ARGV commandlines).

So far I have tried:
Gulam: Rather old and doesn't run so well with scripts. (Some commands
are rather buggy).
Mupfel: Works well except has no conditional commands for scripting.
Okami: Too large with large memory overhead. A bit complicated to
figure out without knowing german. Looks good though.
Master: Too large and not enough like Unix. (too much like Dos :-( )
Msh (MWC Micro Shell): Okay but too old, too slow, and not free.

Obviously the ports of tcsh, bash, ksh, ash etc. for MiNT are not really
suitable without a HD full of utilities.

Any suggestions or comments welcome. I've really been looking for
something on and off for over 6 Months, without much satisfaction.

Cheers,

I did here about these STFM way back, dealers did not wanted to touch them.

There is a very simple reason, they have surface mounted parts, RAM/MMU
and CPU from what I have been told, they might even have a MMU that only
supports 1/2 meg..

So none of those upgrade kits will work...

This was some years back, no wonder they are trying to sell them cheap,
no body wants them....

:
: I did here about these STFM way back, dealers did not wanted to touch them.
:
: There is a very simple reason, they have surface mounted parts, RAM/MMU
: and CPU from what I have been told, they might even have a MMU that only
: supports 1/2 meg..
:
: So none of those upgrade kits will work...
:
: This was some years back, no wonder they are trying to sell them cheap,
: no body wants them....

How do you know this? Anyone else know anything about this? A friend of mine bought a 520STFM an it was just like a 1040STFM minus half the DRAM chips. The holes were drilled for the second row, they just hadn't been installed. All he had to so was add the missing chips and some resistors or capacitors that were also missing and he had a 1 meg machine. I think that he later added a 4 meg expansion to it. No problems with the MMU at all. Maybe not all of the 520STFMs were like this. I don't know. But I -saw- this, didn't just hear about it. I do seem to recall that there was a certain model number of MMU that didn't work right with RAM expansions. I saved some info about this but can't find it. So, I don't have the MMU model number in question or recall what its limitations were. I also recall a guy who had an Atari dealership who claimed that a technition who worked for him figured out what the problem with that MMU was and how to make them work OK. He wouldn't tell me what the trick was, but claimed that he knew. I never heard anything about surface mounted chips in any STs, but that doesn't mean that it wasn't done. But if it was, I never saw mention of it. Anyway, anyone know anything more about this? Gee, that was a lot of 'any' works for such a short sentence, don't you think. :-) Mark...

2589. C-KERMIT 5A 189

Newsgroup: comp.sys.atari.st
Date: 1993-08-14 11:46:18 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <24ijaaINNcjo@golem.wcc.govt.nz>
Source record: 202610
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I see that there is a update for C-KERMIT its now 5A 189, there is even a update for the Amiga...

So come on you Atari fanactics/Bigots were is the Atari version..??

Or is it more like there is no more support for Atari in the USA any more..??

I also read in the old version that they did not know how to read the DTE speed, well its true for old TOS 1.0 or 1.2, but from memory you can with a call to Rsconf, with baud = -1..

May be some one should tell the person that did the last port of C-Kermit, and also follow the lead in not supporting TOS 1.0 and 1.2..

There is one thing that I would like Atari to do is to make available TOS 1.4 UK in 2 chip sets, from what I have read, they are almost impossible to get..

The reason could be that you can only get TOS 1.4 2 chip sets in ROMS and not EPROMS, any one can blow EPROMS but not ROMs...

Roger..... sheppard_r@kosmos.wcc.govt.nz

2590. Need real time clock routine for midi sequencer

Newsgroup: comp.sys.atari.st
Date: 1993-08-14 14:05:00 UTC
From: apolivka@x102a.ess.harris.com
Message-ID: <1993Aug14.140500.14909@mlb.semi.harris.com>
Source record: 202612

I want to write some software for my ST that somewhat resembles a midi sequencer. I've written other midi software, but never anything requiring a real time clock. Can anyone tell me how to do this or point me to some public domain source code containing such a routine?

Specifically, I just need to know how to generate a trigger of some sort every X milliseconds (where X is adjustable by the user prior to running the sequencer-like program). I know how to do the rest of the program. (I would use the trigger to wake up my routine that sends out a midi message.)

I will be writing in Personal Pascal (because I am most comfortable with that language package).

I believe there were a few megafiles that used Adaptec controllers for MFM or RLL drives, but for the most part they were SCSI drives with ATari's screwed up host adapter on them. You should be able to just bypass the host adapter in the Megafile and got with it like that.

Ok, granted you're kind of stating this all tongue-in-cheek, i think they really should be able to port DM 2 to the ST/Falcon and expect to sell pretty good. If you look at the most widely purchased software on the ST it undoubtedly is DM.

Part of the reason may be that it had a killer copy protection scheme... you didn't hear about cracked versions floating around for about a year after its release, though.

But I personally think that a port could be done without too much trouble and they'd probably sell a copy to every ST user in North America.

(admit it, you'd probably buy it, too. :))

2599. GNU C vs. Lattice C

Newsgroup: comp.sys.atari.st
Date: 1993-08-14 18:17:55 UTC
From: cmedley@wam.umd.edu
Message-ID: <24ja8j$9al@cville-srv.wam.umd.edu>
Source record: 202620

I've been using GNU C pretty seriously now for a few months and I've even gone so far as to try to fix the layout of my hard drive so that it is optimized for maximum speed... the problem is, even on a 16mhz 68000 (Fast Technology) it is slow. Now, I can't afford a Falcon at the moment, nor a TT.... and I'm wondering if Lattice C does a faster compile than GNU? Will the executables wind up any more or less optimized? I don't want to start a compiler-war or anything but I'd really like to hear from other users about their preferences. If I do choose to go with Lattice, i'll be spending about $180... and so i'm hoping it will be well spent....

> owners also still have interest in ST issues...)

You forget that people that hasn't had an Atari before, but just bought their Falcon, don't want to read a newsgroup full of discussions they don't understand .... they want a comp.sys.atari.falcon, and since it WILL be an active group (the traffic here about the Falcon is quite good) my opinion is that we should try to get it created.

Also, in a few weeks someone ought to start a newsgroup for the Jaguar .. ;)

The Falcon is NOT a sequel to the STE, but a NEW computer that is TOS compatible. It should have it's own newsgroup.

Well AIUI they are new units, being manufactured now, but cheapo made ones, using surface mount technology, which is what makes them cheap.

Unfortunatly upgrading memory etc is a soldering job.

From: bill@main.morris.org
Message-ID: <24k0l3$d5i@c3po.jvnc.net>
Source record: 202627

Ive got a 350mb 3.5" IDE drive just laying about, for general
reasons, and am wondering what it would take to put it in my Falcon
in place of the 80mb?
Excluding such niceities as opening the case and voiding the
warrenty, is there any software I need to setup? I guess I would need
to install all the software from the supplied diskettes, and format
the drive via the Atari HD utility?
But I also seem to recall that there is NV-RAM in the Falcon,
altho Ive never come across a utility to show me whats store there,
would I need to fondle this, or would the AHDI program take care of
that?

Thanx

2610. Problems with zoo21.ttp?

Newsgroup: comp.sys.atari.st
Date: 1993-08-15 01:36:46 UTC
From: swhatley@blkbox.COM
Message-ID: <CBs1tD.2I3@NeoSoft.com>
Source record: 202632

I have recently downloaded zoo21.ttp from a.a to make sure that I had the latest version. Now, whenever I try to un-zoo a file I get two bombs. The files I have tried to un-zoo were zoo21bin.zoo, zooshl06.zoo and nh313gem.zoo.

I even tried puting zoo21.ttp and zoo21bin.zoo on a blank floppy, turming off the hard-drives and my ST and running zoo from the floppy with just my ST turned on. Nothing seems to work.

I have a Mega 4 ST running TOS 1.2. Any help will be appreciated.

Thanks,
Steven Whatley

2611. big minixfs partitions

Newsgroup: comp.sys.atari.st
Date: 1993-08-15 02:27:14 UTC
From: llunch@backus.cba.csuohio.edu
Message-ID: <1993Aug15.022714.7946@news.csuohio.edu>
Source record: 202630

Well, I decided to try a 105 meg partition and got the
following results:
Logical lrecno error
XHDI not supported
Physical lrecno OK

Hard disk access information:
Access mode: Physical mode
Partition start: 1
Unit number 1
ACSI bus: device 1.(Non-removable)
Non lrecno access

102536 Blocks, 34192 Inodes.

How can minixfs access all of this partition in physical mode without
using lrecno? After less than a day, I ran into problems. A file
used a block belonging to another file. After fixing this fsck still
complains:
Pass 1 Checking All Inodes
Pass 2 Reading Directories
Pass 3 Checking Connectivity
Checking Zone Bitmap
Zone Bitmap : 2989 Errors
Install A New Map?
Checking Inode Bitmap
Inode Bitmap : 145 Errors
Install A New Map?

I think someone on the net mentioned fiddling with root sectors in
order to use large minix parts. I don't know how this works. The
physical root doesn't seem to contain any information that would need
to be changed. In the partitions root, I could decrease the sector
size, but could not increase the number of sectors accordingly, since
this is a short. Also, the docs don't mention the need for any such
weirdness. I'm hoping that I have this set up wrong somehow, and that
once everything is as it should be, I can use this partion without
worry. I moved stuff onto it with gemini, and I'm not sure wether
nohog.acc was loaded or not. Perhaps I didn't give the cache time to
do its thing, but 3000 errors!?

In answer to someone's reply to a previous post I made on this
subject, my mint.cnf looks something like this (a reply which I cannot
,at the moment, find):
sln c:\rootbin u:\bin
ren u:\e u:\etc

```
#a twenty meg minix part on the same drive as c:
ren u:\f u:\usr
#the huge partition in question
ren u:\r u:\tmp
#ramfs
#and of course /usr/tmp is a symbolic link to r:\\
```

It would be nice if I could mount a part on /usr/local rather than have my root directory filled up with useless junk. This is hardly a

: -------- --- -------- --------- --------
: 626625 60% 248684 5 files

This is definitely not Ckermit 5A(189). 189 only came out a few
weeks ago. Note the January 7, 1993 date. I would hazard a
guess that this is (185).

Cheers,

Chris

sr> ROMS and not EPROMS, any one can blow EPROMS but not ROMs...

The reason that you can't get 1.4 TOS in 2 chip set Eproms is due to the fact that 1.4 came in a 1 megabit chip. They don't make 1 megabit chips in the Eprom variety in 28 pin packages; there just ain't enough room on the package for all the pins you need. If you drop the Vpp and programming pins though, you can gain enough room on the package to make a 1 megabit mask programmed ROM, and still put it in a 28 pin package.

Later,
Gizmo

| The Atari Emulation Card for PC Compatibles |
------------------------------------------------------------------------

[Windows 3.1 ] Last year we released Gemulator, the world's only Atari
[screen dump ] ST emulation card for DOS based PCs. With the freedom
[shows Gemul-] to run Atari ST software on a PC just about anywhere,
[ator running] over 500 Atari users just like you are already using
[Atari XE DOS] Gemulator on their PCs at home, at work, at school, and
[2.5 and Cal-] when they travel.
[amus SL. ]

Gemulator turns a PC into an AWESOME ST clone:
- TOS 2.06 ROMs included,
- 640x480 and 800x600 color graphics,
- 1.44 meg floppy disk support,
- modem, printer, and sound support,
- emulates up to 8 meg of RAM,
- Atari 800 emulation,
are all standard features of Gemulator. No need to buy a Falcon or spend
$$$ upgrading your ST!
------------------------------------------------------------------------
| Gemulator 3.0 will be on sale at the Glandale show, Sept.18-19, '93.|
------------------------------------------------------------------------
|Gemulator is fully compatible with: Pagestream, Calmus /
Highly |Calmus SL, MultiTOS, Geneva, Silhouette, Pha$ar,
Compatible |Word, Hotwire, Multidesk, Maxifile, GDOS/G+PLUS, Quick ST,
Emulation |Warp 9, Word Flair, EZ Calc, Sudden View, Laser C,
|ST Xformer, Magic Sac, Interlink, Avante Vector, Thunder,
|UIS III, Data Master, Turbo ST, NVDI, Extended Control
|Panel, Word Flair II, and hundreds of other Atari ST
|programs, utilities, and desk accessories.
|
|Gemulator requires only a basic 386 or 486SX PC. A new
Inexpensive|486SX system including VGA monitor and hard disk now costs
To Install |under $1200. So for under $1500 you have a 486 computer
|that's also an Atari ST clone with double the memory limit,
|double the screen resolution, and double the disk storage
|of a real ST! Just price yourself what it would cost to
|either upgrade your existing ST to TOS 2.06, VGA graphics,
|1.44 meg floppy, and 8 meg of RAM, or what it would cost
|you to buy the Falcon (if you can find one) and you'll see
|that Gemulator is a very sensible alternative to using an
```

Reviewed |ST. Product reviews in Current Notes (April 1993) and ST
|Informer (June 1993) agree.
|
|On fast 486 machines, Gemulator runs 2 to 3 times faster
Fast And |than the ST. That's as fast as the Falcon, and because
Powerful |Gemulator emulates the 68000 chip, not the TT's 68030 chip,
|Gemulator can run software that won't run on the TT or
|Falcon. For compatibility with ST software that does not
All TOSes |run on TOS 2.06, the Gemulator card allows you to plug in
|any earlier version of TOS. How easily can your ST switch
|between TOS 1.0, TOS 1.4, and TOS 2.06?
|
|Gemulator eliminates the need for having two monitors,
Graphics |since your PC's monitor can display all ST screen modes.
|The screen dump above shows Gemulator using a 640x480
|graphics mode, running Calamus SL under Windows. Gemulator
Sound |now supports sound by using your PC's Sound Blaster, Sound
|Blaster Pro, or AdLib sound cards.
|
|Gemulator gives your ST software access to the PC's hard
Hard Disk |disk. Use Atari's HDX utilities to autoboot from the hard
|disk. Create up to 4 32-megabyte ST partitions, or share
|files with PC programs on existing DOS partitions.
|
|Gemulator runs on laptop PCs, even color laptops, allowing
Laptop |you to use your favorite Atari ST software almost anywhere,
Ready |on smaller and lighter machines than the Atari STacy. All
|you need is a laptop with an 8-bit card slot.

The complete Gemulator 3.0 package lists for only $299 U.S. at an Atari
dealer near you, or contact Toad Computers, Rising Star, Floppy Wizard,
Xanth Computers, or PMC to order by
phone.
For a demo video, upgrade information, or more product information,

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,0

From:
B R A S O F T N E W S
The official newsletter of Branch Always Software. August 1993 issue.

Introducing Gemulator 3.0

If you have never seen Gemulator, picture this: You plug a small card into your PC. The card is the Gemulator ROM reader card which allows your PC to use the Atari ST's TOS ROM chips (TOS is the operating system which gives your ST the GEM interface). You then install the Gemulator emulation software into your PC's hard disk and run the emulator. In a few seconds, the familiar Atai ST desktop is up on the screen. Insert a disk, click on the A drive icon, and a window opens. You click on a program icon and in a few seconds you are running Atari ST software on your PC!

The whole Gemulator package, including the ROM reader card, a set of TOS 2.06 ROMs, and the emulation software (version 2.1) currently sells for $229 U.S. Without the ROMs, if you wish to use your own TOS ROMs, the package costs $179 U.S.

Gemulator 3.0, when introduced in September, will continue to sell for $229 with many new features added. If you are now a Gemulator user you can look forward to such new features as:

+ 800x600 16 color graphics and faster screen redraws
+ multiple ROM card and cartridge ROM support
+ sound (requires Sound Blaster or AdLib card)
+ hard disk autobooting and support for the HDX driver
+ modem support (using either COM1 or COM2)
+ Atari 800 emulation
+ numeric keypad support
+ more automated emulator configuration
+ improved compatibility
+ a new easy to read printed manual

And because Gemulator emulates the standard 68000 chip, the same microprocessor that's inside the ST, STE, and Mega ST computers, it can run Atari ST software that doesn't always run on 68030 based machines like the TT and Falcon and 68030 upgraded STs.

Gemulator 3.0 goes on sale in September.

How To Order The Demo Video and Upgrade To Gemulator 3.0

The Demo Video (on VHS tape) will be available in late September.
The cost is $20 and may be ordered by anybody.

Until September 3, 1993, all registered Gemulator users can upgrade to version 3.0 for only $30. We must have your registration card on file, so please send it in if you haven't
already. The upgrades will be sent out in early September prior to the Glendale show.

If you recently purchased or upgraded to Gemulator 2.1, i.e. after July 1, 1993, you are entitled to upgrade for only $10. Simply enclose a copy of the sales receipt from your dealer to show the date the product was purchased. After September 3, 1993, all upgrades will be $60.

Registered Gemulator users who require addition Gemulator ROM reader cards for use with the Gemulator 3.0 upgrade (to use with additional TOS ROMs or cartridge ROMs) may be ordered for $129 per card in addition to your upgrade fee.

All orders must be payable to Branch Always Software in U.S. funds by personal check or money order. Send payment to:

Brach Always Software, 14150 NE 20th St, Ste.302, Bellvue, WA 98007 USA

Shipping is free within Canada and the United States. Add $5 U.S per order for shipping anywhere else.

A U T H O R I Z E D G E M U L A T O R D E A L E R S

List price is $229 U.S. with TOS 2.06 ROMs. Prices in Europe may be slightly higher and vary due to flucuations in exchange rates.

I haven't had the problem, but I've heard of it. Did it used to work
before DOS 6? There's a program called fdread that can help a lot. It's
a tiny little tsr and it will let the computer read all kinds of
different formats.

2624. Re: big minixfs partitions

Newsgroup: comp.sys.atari.st
Date: 1993-08-15 15:14:55 UTC
From: shenson@nyx.cs.du.edu
Message-ID: <1993Aug15.151455.25321@mnemosyne.cs.du.edu>
Source record: 202642

Since I'm ignoring the previous post you'll have to ignore this too :-)
If minit creates a partition then it should mean that minixfs should be
able to access it OK. All this business about boot sector editing applied to
previous versions, its all automatic now (or most of the time).
Without nohog.acc running Minixfs will almost never get a chance to
flush its cache with pre-MultiTOS (a test I ran showed 'never' is a good
approximation). Whereas the main caches get parts of them written out when
new data needs the slots the bitmap caches only get written out (in Turbo mode)
when the update daemon does a sync(). 3000 errors is thus quite possible. In
any case you should never be afraid to let fsck fix the bitmaps, this will never
lose any data. Using a filesystem with bad bitmaps will almost always result in
far more serious errors later which *will* lose data.
All of this willl eventually be described in the revised docs I'm in
the process of preparing.
Steve.

2625. Everest Text Editor

Newsgroup: comp.sys.atari.st
Date: 1993-08-15 15:57:30 UTC
From: staylor@cix.compulink.co.uk
Message-ID: <memo.559397@cix.compulink.co.uk>
Source record: 202505

Everest is a shareware text editor written by Oliver Schmidt in Germany.

Everest offers the following features:

- runs with all Atari 680x0 computers and with all known graphic cards
(apart from ST low resolution (320*200))
- fast scrolling on all models, with or without the blitter
- no cursor overrun (or similar annoying glitches)
- standard GEM interface
- Turbo C Editor compatible keyboard shortcuts
- capable of loading large (>300Kb) files without problems
- almost every command can be controlled via the keyboard, drop down
menus or dialogs (even block marking!)
- enables the use of GDOS (mono-spaced) fonts, provided GDOS is installed
(The fonts supplied with Gemini are particularly recommended)
- no external RSC file, so Everest is well suited to residing outside
folders on the root directory
- Everest employs dynamic memory allocation to leave the maximum possible
memory for other applications. Ideal for multitasking environments and
accessories
- Hard tabs
- GEM Clipboard support
- Turbo-C Help Accessory support
- up to 10 active files. Although most TOS versions only support 7 windows
various utilities are available to increase this limit.
(WINX is recommended, with support for up to 120 Windows!)

I started using Everest because it was fully MultiTOS compatible, unlike
Tempus 2 which had been my previous favourite.

So far all official releases have been in German but some time ago I
converted an old 1.5 release to English and released it in the UK. This
release appeared on the ST User cover disk, July 1993.

Version 2.3 is the current version and although I have performed an English
conversion on this I have only released it to registered users. Oliver is
now working with the person who did the translation for me to provide
official English releases starting with version 2.4 which I have a beta
of. That's one other good thing about Everest, it's still getting better.

In the UK registrations are now handled by jconnor@cix.compulink.co.uk as
are suggestions for improvements from (hopefully registered) users.

I shall soon be uploading my unnofficial English 1.5 release to a.a.u.e
under the name EVER15_B.ZIP, just a soon as my internet link is working OK
anyway :-(

Steve.

2626. Re: Adding a new drive to a Falcon

> Excluding such niceities as opening the case and voiding the
>warrenty, is there any software I need to setup? I guess I would need
>to install all the software from the supplied diskettes, and format
>the drive via the Atari HD utility?
> But I also seem to recall that there is NV-RAM in the Falcon,
>altho Ive never come across a utility to show me whats store there,
>would I need to fondle this, or would the AHDI program take care of
>that?

Assumed that the drive actually WORKS in the Falcon, it won't fit in there
since the F030 requires a 2,5" drive.

But anyway, you'd need an adaptor cable and a new F030 case. Then HDX should
recognize and format the drive, HINSTALL.PRG will make it bootable.

bye, Peter

The normal STfm has a 68000 in it, which doesn't contain a MMU. That's one of
the reasons why MultiTOS doesn't run that well on normal ST's

The only reason I wouldn't buy one is that it can't do MIDI. If it did
MIDI, I'd be happy. :)

(Add MIDI and you'd get a lot more sales)

Also, does it have HD support? Later in the post it says it does i think
for using PC HDs, but I'm not clear as to the difference....

Agreed, But to nitpick, FTL isn't the one doing DM2, its Interplay. I think
the last game they made for the ST was Another World. (but was reallly
made by delphine)

isn't FTL dead?

Well... where's the MIDI support... didn't they realize that without supporting the accuracy of a normal ST's MIDI port structure that this GEMULATOR is doomed a quick death? No... trust me... it will die. MIDI makes up 90-95% of the market of the ST. Sure MIDIots will also play games and the such, but no MIDI? no way... it's a LOT cheaper to buy an STe w/8MB's and a monitor. A LOT. $600 for instance (used prices no doubt) max will get you a killer ST system.

2634. Help with Ishar II

Newsgroup: comp.sys.atari.st

From: jhoffman@netcom.com
Message-ID: <jhoffmanCBtH5D.HEu@netcom.com>
Source record: 202501

Help. I've been playing Ishar II and am totally stumped. I in the dungeon on Akeer Island. I have two doors in the area with the fire pots that I can't get open. I also wonder if I missed something in the Amphibian area. I put gold in all three baskets opening all the gates for the amphibians but didn't seem to accomplish anything except releasing more amphibians to fight. I also have four skulls which I've placed in the baskets in the sorcerers secret room. Unfortunately there are 6 baskets available. Presumably if I fill all 6 the door at the end of the hall will open. Hopefully this will give me something useful. NOT more Gold! Gads each character in my party now has 150,000 gold and nothing to use it for...

If anyone can suggest help please email me or post a hint.

Thanks,
John

2635. Compile MiNT - Help

Newsgroup: comp.sys.atari.st
Date: 1993-08-15 20:33:19 UTC
From: tiemann@stud.ee.ethz.ch
Message-ID: <tiemann.745446799@elektra>
Source record: 202502

Hello,

I'm triing to compile MiNT 1.08, but that's not too easy for me,
since I've never compiled ANY MiNT version before :-).

Could anyone who has done this before tell me, if my assumptions are
wrong?

I'm using the Gnu Compiler V2.4.1 and the MintLibs34.
Is the makefile in the distribution intended for the use with
Gnu C?

I'm getting a lot of 'unrecognized options'! Also there are
problems to compile a header file (mint.h).

Here is the output I get 1) with "make mint.prg" 2) typing the first
command by hand (without using the make utility):

```
--- cut ----------------------------------------------------------------------
F:\FIDO\ARCHIV\MINT108S> make mint.prg
gcc -d1 -Oloop -v -cfsb -cag -e -w -b0 -r0 -bn -aw -j30e86e100e104e135i154e159i
-DDEBUG_INFO -ph -omint.sym mint.h

D:\gnu\gnu\bin\make.ttp: *** [mint.sym] Error 127
F:\FIDO\ARCHIV\MINT108S> gcc -d1 -Oloop -v -cfsb -cag -e -w -b0 -r0 -bn -aw -j30
e86e100e104e135i154e159i -DDEBUG_INFO -ph -omint.sym mint.h
gcc: unrecognized option `-cfsb'
gcc: unrecognized option `-cag'
gcc: unrecognized option `-r0'
gcc: unrecognized option `-aw'
gcc: unrecognized option `-j30e86e100e104e135i154e159i'
gcc: unrecognized option `-ph'
gcc-atariST version 2.4.1 Patchlevel 1
gcc: Compilation of header file requested
--- cut ----------------------------------------------------------------------
```

Any help would be appreciated!

Yours
Bjoern

2636. MiNT 108?

Well, I never heard of STe's going to 8MB, but a 4MB STe can do a fair job
of MIDI sequencing provided you have a good program.

I guess if I were to spend the $2k I'd spend on my dream PC system, I'd
pay a little more to switch over to Cubase for Windows as well rather than
buy GEMulator for MIDI because I don't think it'd be as stable as running
a sequencer under its native environment.

MIDI makes up 90%+ of the Atari market? That sounds high to me, based
on the share of MIDI articles and software I see in the magazines and on
on-line services. What leads you to think that MIDI is such a dominant
influnce?

Try formatting the disks you want to use on the PC instead of on the
ST. It shouldn't matter if your ST has TOS v1.04 or higher (with the
exception of v2.05, which mungs the format of 1.44 disks...)

If VKILLER can't get it straight, you could try Double Click's DC-Formatter
(should be available on a.a) which works fine for me.

Source record: 202518

Hello,
Does anybody know how to get in touch with Interplay? I for one would like to write to them and tell them how much we want the game on our system! Now, if we could get everybody to do that, it'd probably show them that there would be a market for them on our platform. Anyway, I'm guessing that they'd sell about twice as many ST versions than PC versions. After all, DM has had a LARGE following for an awful long time (at least on the ST).

....

In my opinion, mihocka has a real good thing going here. People
who need midi will pay to get it anyway. People who don't but who
admire the ease of use of GEM and the power of software like CAlamus
will gladly go for this. Let's face it... the 486 is more certain to
last than the the Atari, and is more easily available and serviceable.
Unless the falcon really takes off big, my way of upgrading from the
STs I own would not be to the Falcon. It might well be to a 486 and a
Gemulator so that my investment in files and software I love is
preserved.
The atari has always been able to do things no MessyDoss system can
do, and do it faster, smoother and more pleasantly. If I could now
get a cheap 486 and an emulator, I would have the best of both worlds.
The only thing I would miss would be the Spectre/GCR emulation. If I
were Small, I would join Mihocka on this one.

A 486 may be more serviceable, but what about the GEMulator board itself?
I'm looking at this in terms of a system purchase... will Mihocka be able
to support GEMulator for as long as ST/Falcon systems ship?

Will he continually provide upgrades? What type of upgrades does he offer
now?

And as small as Atari is, a 3rd party company like his is even smaller, so
getting support may be even more difficult.

>Unless the falcon really takes off big, my way of upgrading from the

Well, my own personal attitude is that when (not if!) i get a 486, I'm
going to buy all new software, and convert as much as I can to run under
whatever native OS I'm using on it. There may be a Falcon in my future, too,
simply for Direct-to-Disk recording... <it's cheaper than anything else i've
seen for the job>

>thousands of units companies like FTL and Spectrum Holobyte could be pursuade
>to return to converting their games for Atari machines...

Well, all that remains is to find out how many N. American ST machines are
out there. :) I mean, if there are about 200,000 in use, I'd say that
was a large enough market to make the port worth it (although i'd put it
at a lower priority than the 386/486 port).

Of course, one thing to consider is that even if they did do DM 2 for the ST,
it will be running in 320x200x16 colors whereas a PC version may be doing
VGA graphics with SoundBlaster Audio.

<Funny thing to consider.. in the time since the original DM was made, PCs
have become better game machines than STs...>

At a.a.u.e you'll find acc13, by Murray Levine (excuse me for the spelling of your name), that worked well on both my 1040 STF and my Mega STE 4 / TOS 2.05..

Install it in your Auto folder, and place your accs in the ACCS folder...
Really nice... Used it for a year now, and I didin't have any problem since...

It also doesn't need a Hard Disk. Since my HD broke I've been running
it off floppy with no trouble. (It helps to put a few things on
RAMdisk though :-)

>- And waits for angels by the road -

I'd buy an Mega STE instead...
They become much cheaper now, they have a very good case and keyboard, an
internal SCSI host adapter, a real-time clock, THE NEWER tos 2.06 (with NEWDESK
that is really better than Desktop), 3 RS232 lines, 16 MHz+cache CPU
(nive even with VROOM , EPIC and Formula One) and a VME Bus (mainly for
graph. cards), a LocalTalk port, is easy to open and upgrade, ...
why bothering putting a STE card in a tower case ?
It's a little more expensive first, but you won't regret it after, I'm sure...

C>Has anyone had any problems with the BeforeDawn screen saver?
Me not ;-)

C>This is a 4M 1040STf with TOS 1.04, ICD host adapter, nothing too
C>exotic in C:\AUTO (pinhead, poolfix, serialfix, vdifix, nvdi, lgselect)
C>or in ACCs (Before Dawn's ACC, Maxifile, XControl).
Hmm, at first, You should copy the DAWNAUTO.PRG to C:\AUTO, but I guess You did
this.
To test Before dawn, disable all the other stuff (ACC and C:\AUTO*.PRG)
and let only DAWNAUTO and DAWN.ACC be startet.
If You STILL have problems, it's the saver (or Your computer).

But some further information would be quite helpful:

- which version of Dawn do You have?
- TOS 1.04 doesn't install a cookie jar. If one of the AUTO-programs does
this, let it be startet too (before DAWNAUTO.PRG this TSR only does install
a Cookie)

>

What do you mean with "v2.05 mungs the format of 1.44 disks" ?

I have 2.05, and I have no problem reading a 1.44 Meg disk on a PC...
I don't really remember whether I formatted it on the desktop or with Pump up
the volume, though ...

What's the exact difference between 2.05 and 2.06 ?
I was told it's the same as between 3.05 and 3.06, i.e differences in AES, but
I don't know ANYTHING ELSE about it !!!

Thanx!

>no body wants them....

You seem to be getting up to your old tricks again Roger - most of this is rubbish.

Firstly there are many places in England who will upgrade STFMs - There are basically 3 ways of doing this:

1. Upgrade to 1Mb by soldering the chips into the spaces on the board (The only difference between 520STFMs and 1040STFMs was the number of memory chips soldered in, and on early ones the disk drive). There are however a few problems with doing this:
a) The 256kbit chips are hard to come by nowadays.
b) It is a time consuming job
c) It was rumoured that some 520STFMs were 1040s rejected because of pcb faults in th of the second bank of RAM, so they wouldn't be upgradable in _this_ way.

2. Solder or clip (eugh!) in a high density board containing either .5Mb, 2Mb or 4Mb of memory. These are generally not upgradable (an exception was Xtra-RAM).

3. Solder or clip in a SIMM board. These are sold by Marpet and another company I forget the name of.

(1) is not generally offered by companies who sell (2). (3) is becoming the most popular.

It is true that the existing RAM is surface mounted on STFMs, but this is irrelevant as you wouldn't want to touch it. Likewise the CPU.
The MMU (really a memory controler) is surface mounted on some machines, but it is still easy to solder to. Many clip on upgrades connect to the shifter chip which is socketed (at least in 90% of cases).
No MMUs were released that only supported 512K - all supported 512K, 1024K, 2Mb, 2.5Mb or 4Mb (and possibly 128K and 256K) until the STe some of which won't handle 2.5Mb.

Your "So none of those upgrades will work..." quote is the biggest load of crap I have heard since you ravings about Zoo.

HOWEVER

An Atari spokesperson was quoted as saying that the new 159 pound 520STFMs were NOT upgradable. This could mean one of four things:

1. The custom chips have been redesigned (probably combined) and now will only handle .5Mb of memory. It is completely impossible to upgrade the memory.

2. Changes to the motherboard mean that there it is no longer possible to solder in another bank of memory to give 1Mb. However, existing alternative methods will work.

3. The computers are just the same as the old STFMs, but in Atari's view they were not upgradable either, despite the facts given above.

4. ST Format mis-quoted him/her.

I don't even know if these new machines are actually available yet (or ever will be), but until someone buys one and looks inside we will never know.

My personal view is that there is no point in buying a machine with only .5Mb of memory and the 40 pounds minimum it's going to cost to upgrade one means you'd be better off with a new STE, or for even better value a 2nd hand one with loads of memory.

Compiled it on a MegaSTe in 2.5 h (on Minixfs 0.60 pl6)

I had to repair the proto.h where some lines wraped aroung which
shouldn't.
GCC (2.4.5) gave an out of memory error when compiling
fasttext.c with 1.7 MB free before starting GCC. After removing
the ramdisk everything went fine.

The new version of MiNT, GCC, bison (?) need TEMP and TMPDIR set
to /tmp/ instead of /tmp, which i used to compile MiNT 1.04 with
GCC 2.4.2 on MiNT 0.95.

MiNT 1.08 works fine.

To me Leo you sound like most STUPID TEENAGERS that have no Gray matter
in between there ears at all, or any Manners.

I have been a Computer Engineer and Electronics Engineer for some 33 years,
and I do think I know what I am on about, but from your Reply, you don't.

I wish People like you would refrain from giving People False info here on
Internet...

The Info on the STFM not being upgraderbal, comes from UK dealers and
on machine that I have seen...

I stand by my statment on this and my past statements on ZOO, and so do all the
other users here that I have come accross...

Also there was never any Ram upgrades ever sold here in New Zealand at all,
they were deemed unreliable, I have had to remove some of the imported ones
myself, because of the damage to the MMU socket...

Roger..... sheppard_r@kosmos.wcc.govt.nz
Facts not Fiction..!!!

I also bought an Xtra ram board a month ago, it did not work after installation. I checked & checked & double checked using their trouble shooting guide. I reseated the MMU connector several times, still no fix.

I eventually found three bad connections on the shifter board (Data lines D1,D2 & D3 were open circuit). After repair everything worked ok.

So much for an "easy upgrade", took a few hours to resolve.
The upshot is, I can never remove the board as the MMU socket is so badly damaged that the ST won't work without it!!

They should have mentioned this in their advertisements.
I would not buy a second one as I now question the reliability of this method of memory urgrades.

NOTE: For those who don't know, the MMU connection forces pins between the MMU socket pins & the socket walls. When you remove this connection, the socket pins often have poor contact with the MMU.

To be fair, they do offer a 10 day money back promise, two year guarantee, & advise purchasers to return boards which fail to work. It still leaves your ST in worse shape than before though.

I will "roll my own" next time.

I read about a mouth ago from a Bob Brodie RTC on GEnie,
that they had stoped shipping Falcon computers, because of
Hard Drive problems, they even called in the manufactures of the Hard Drives...

Well I have since read the reason in the latest GEnie Lamp Magazine (360)

there were problem with the Hard Disk RF sheild was causing
Electrical Interference to the Hard Drive, (spin-ups spin-downs)
there is mentioned a Dealer modification or Fix, but there were
no details given...

May be some one could give others here the Fix for this, the users that brought
there machines by mail order from overseas...

Could this be another reason that Atari droped the 60 meg drive
for a 80 meg one..??

Roger.............. sheppard_r@kosmos.wcc.govt.nz

For programming only in C I use PureC from Application Systems Heidelberg (it is derived from
TurboC from Borland). It will cost $180 in germany.
It is speedy and comfortable.
For programming with C++ there is no alternative to gnu.
ok, gnu is slow for compiling (because for every step there has to be one run: preproc., compiler, linker, ...) but the compiled code is very fast.
I hope that ASH will come out with an c++ compiler this time. :-)

|> tim@rider.cactus.org

This is from an old post... I mailed a letter to Interplay, but got no response
from them.

Dungeon Master II (yes,II) is planned for release this christmas by
some folx from FTL and the Interplay-crew.A good news,indeed.
And it will be a fantasy-RPG.
Bad news is that it'll only come out for PC.So if you want to see this
WONDERFUL,FABULUOS,GREAT,HYPER-GALACTIC game coming out for your favourite
computer - write to Interplay at:
Interplay Productions
17922 Fitch Avenue
Irvine CA 92714
Tel: 800-969-GAME
Email: 76702.1342@compuserve.com
interpla@orion.oac.uci.edu
BBS: 714-252-2822
FTP: none

(I took this info about Interplay from Sir Lancelot du Lac's e-mail list.)
Mail and/or e-mail them!!! We all would like to see this game for OUR
computer - not this PeeCee-crap.

Matthias

P.S.:Maybe we should start a mailing-list,like 'ALL non-pc's of all
countries unite.You have nothing to loose,but your personal copy of
Dungeon Master II !' *smile*

I don't see what the problem is here. If the memory upgrade works, why would
you even be concerned about not being able to remove the board from the MMU
socket? Once the thing is in place and working, just leave it alone. I have
an X-tra RAM upgrade in my 520STfm and it works fine.

I think in an interview of the Pure C developpers made by the French Magazine ST magazine, they said that since the Atari market is insufficient to amortize the development of a C++ compiler, there WON'T DE ANY C++ COMPILER FOR ATARI COMPUTERS FROM PURE SOFTWARE.

That's really a shame, Pure C 4.0 including C++ would be so great (With Pure Debugger++ :)

Ditto.

>The Info on the STFM not being upgraderbal, comes from UK dealers and
> on machine that I have seen...

Are we talking about the original machines, or the re-released ones? What
did you see in the machine that made it un-upgradable. I think other people
would be interested in this too.

the
>other users here that I have come accross...
>Also there was never any Ram upgrades ever sold here in New Zealand at all,
>they were deemed unreliable, I have had to remove some of the imported ones
>myself, because of the damage to the MMU socket...
^^^^^^^^^^
OK, so I'm haven't been an Engineer for 30 years, but you said the memory
controller in STFMs is surface mounted and I was rather under the impression
that this means NOT socketed.

And surely taking the upgrade out would make the problem worse?

I know one person who has soldered chips into their 520STFM to upgrade it to
1Mb, and somebody who sent their machine away to have a 4Mb board soldered in.
Neither of of them have had any problems.

As far as the clip on/stick over the MMU type are concerned, the ones I
have read detailed reviews of can be soldered as well, and it would seem a
good idea to do so (But then I'm no expert).

I stand by my remarks - I feel that what you said was incorrect and would lead
people to unnecessarily selling/scrapping their STFMs when they can be
upgraded. Once I get back to England I will be happy to provide addresses of
UK companies who will perform STFM upgrades to anyone interested.

- Leo

Fortunately, Derek has a day job. :-) He works for MicroSoft, so
I don't think he is doing this for the money. He has been good
about support for his work for Atari in the past and I see no
reason why this should change. His company, Branch Always Software,
has developed other Atari ST products that have met with success
and been well supported.

This is fine for someone working full time in a high paying job. :-)
Not everyone is in that position yet, nor may they be for some time to
come. Those in college or with young families and a mortgage simply do
not have the resources to buy a $2000 computer plus that much or more in

software for it. Since we can't in good conscience recommend piracy, that leaves little choice for some.

Notice I am not directly recommending the GEMulator because I have not seen it run, but Dekek has a good track record and I think you would probably be happy with the product and the support including future upgrades.

Hi,

I recently purchased a Quantum LPS240S ProDrive. Unfortunately, the manuals that came with it are very bare. All they include is the installation guide for it and a table of ProDrive Type Specifications that does not cover the drive that I bought but instead it covers Quantum's 'main' line of products.

If there is, can anyone provide me with the telephone number of Quantum Corporation or if they have one, a support BBS?

Woj. (wojci_g@pavo.concordia.ca)

GEMULATOR VERSION 3.0
The Atari ST Emulation Card For PC Compatibles

Branch Always Software
14150 N.E. 20th Street, Suite 302
Bellevue, WA 98007, U.S.A.

- NEW FEATURES AND ENHANCEMENTS

- SEE IT AT THE GLENDALE SHOW

- NEW DEMONSTRATION VIDEO

- LOW UPGRADE PRICE

- FREE NEWSLETTER

Branch Always Software announces Gemulator 3.0, the Atari ST emulator for PC compatibles. With standard features such as TOS 2.06, SuperVGA color graphics, 1.44 megabyte floppy disk support, and expandability up to 8 megabytes of RAM, Gemulator 3.0 turns a plain 386 or 486 PC into an awesome Atari ST clone. With PC prices at an all time low, there has never been a better time to "gemulate" your PC, especially when you consider the cost of upgrading an existing ST with TOS 2.06, high density floppy, extra memory, etc.

Gemulator 3.0 will be released on September 18th 1993, at the Glendale Atari Show in Glendale California. The price remains at $229 U.S. complete and will be available from various Atari dealers. Current Gemulator users can upgrade to version 3.0 for only $30 before September 3, and only $10 if the product was purchased after July 1.

Gemulator 3.0 consists of a plug-in card, TOS 2.06 ROMs, Atari ST emulation software, Atari 800 emulation software, a screen accelerator, benchmarking software, and some public domain and shareware Atari ST programs. Simply plug the card into any unused 8-bit or 16-bit card slot and run the emulation software. GO FROM DOS TO GEM IN SECONDS!

Any PC or laptop meeting the following requirements can run Gemulator 3.0:

- a 33 Mhz 386 processor (or faster)
- at least 4 megabytes of RAM
- DOS 5, DOS 6, Windows 3.1, or OS/2 2.1
- a VGA card and VGA monitor (SuperVGA is optional)
- one empty 8-bit or 16-bit ISA card slot
- a hard disk and at least a 720K 3.5" floppy disk
- an AdLib or Sound Blaster sound card is optional
- a mouse is optional but recommened for use with GEM based programs

The following features of the Atari ST / STE / Mega ST are emulated by Gemulator 3.0:

- 3 graphics modes (320x200, 640x200, and 640x400)
- a 4096 color palette
- one or two floppy disk drives
- support for up to 4 hard disk partitions
- one serial port and one parallel printer port
- 3 voices of sound
- mouse and keyboard (including numeric keypad)
- real time clock
- ROM based cartridges
- 512K to 8 megabytes of RAM

Gemulator 3.0 also adds these enhancements not found on your standard ST:

- 640x480 color graphics (with any VGA card)
- 800x600 color graphics (Video7, ATI, Tseng, or VESA SuperVGA card)
- maximum ST memory is 8 megabytes, double the limit of an ST
- 1.44 meg high density floppy disks are supported
- support for multiple TOS ROMs

Imagine running any of hundreds of Atari ST and Atari 800 programs on your PC, including (but not limited to) these:

ArcShell Multi Writer
Avante Vector Multidesk
Calamus MultiTOS (68000 compatible versions)
Calamus SL Neodesk
Codehead Utilities NVDI
Data Master Pagestream
DC Desktop Pha$ar
DC Utilties Prism Paint
Degas Publishing Partner
Degas Elite Quick Index
Deskcart Quick Manager
Diamond Back II Quick ST
Extended Control Panel Quick View
EZ Calc Silhouette
First Word ST Writer
First Word Plus ST Xformer II
Flash Sudden View

FontGDOS Supra hard disk utilities
G+Plus Tempus
GDOS Tempus II
GemBench Thunder
GEMvelope TOS 1.0
GFA Basic TOS 1.2
Gribnif Geneva TOS 1.4
HDX hard disk utilities TOS 1.6
Hotwire TOS 2.06
Interlink Turbo ST
Key Master UIS III
Laser C VT52 Emulator
LDW Power Warp 9
LHArc Word Flair
Madmac Word Flair II
Magic Sac Word Up
Maxifile Word Writer

About the only things that Gemulator 3.0 does NOT support are MIDI ports, copy protected disks (typically games), and very machine specific or timing dependent software such as Spectrum 512.

With 8 ROM sockets on each Gemulator card, there is plenty of room for you to plug in other versions of TOS and cartridge ROMs. If you have particular software that does not run with TOS 2.06, you can easily plug in TOS 1.0 or TOS 1.4 and use it instead. Or if you have cartridges like Deskcart, simply remove the ROMs from the cartridge and plug it into the Gemulator card. Gemulator 3.0 can automatically detect up to 4 cards, providing you with a total of 32 ROM sockets!

On fast 486 machines, Gemulator 3.0 runs 2 to 3 times faster than the ST. It scores a GemBench speed index of over 270% running on a 66 Mhz 486 based PC. That's without the use of accelerators such as Warp 9 or NVDI, which are supported on Gemulator and give similar speed improvements as on a real ST. If you don't have a copy of Warp 9 or NVDI, don't worry. Gemulator 3.0 comes with its own custom screen accelerator which runs even fast (it is similar to our Quick ST accelerator but optimized using 386 machine language).

In addition to the 3 standard Atari ST screen resolutions, Gemulator 3.0 also supports 4 VGA screen resolutions: 640x480 monochrome, 640x480 16 colors out of a 4096 color palette, 800x600 monochrome, and 800x600 16 colors out of a 4096 color palette. If you run your Atari ST software in the 800x600 mode you get almost double the screen resolution of a monochrome Atari ST monitor. Twice the pixels means twice as much text visible on the screen or twice as much area of a desktop publishing document.

Gemulator 3.0 now supports the serial port allowing you to run your favorite Atari ST terminal software with your modem. Take advantage of such features as auto redial, type ahead buffers, and editable capture buffers, features not found in most PC telecommunications software.

Gemulator 3.0 emulates the Atari ST's 3 voice sound by using your PC's Sound Blaster, Sound Blaster Pro, AdLib, or AdLib compatible sound card. Simply have a sound card installed and Gemulator 3.0 will use it.

Gemulator 3.0 reads your Atari ST floppy disks directly, and now gives your Atari ST software access to all of your PC's hard disk drives. Simply use your existing Supra or HDX hard disk driver to activate the hard disk support. And using the HINSTALL utility (which is part of the HDX utilities) you can even autoboot from the hard disk allowing you to put your AUTO folder programs and desk accessories on the hard disk.

And if you're a die hard Atari 800 user, you'll be glad to learn that Gemulator 3.0's improved compatibility now allows you to run the ST Xformer emulator on it. Run Atari BASIC, DOS 2.5, and any other program that is supported by ST Xformer. We include a free copy of ST Xformer 3.0, an upgrade from ST Xformer 2.55, which contains several bug fixes and speed improvements.

Interested in finding out even more about Gemulator 3.0? We now have a free 5 page newsletter which describes more of Gemulator 3.0's features in detail. To receive the newsletter, write to:

Gemulator 3.0, c/o Branch Always Software
14150 N.E. 20th Street, Suite 302
Bellevue, WA 98007
United States of America

We are also updating our demo video to include Gemulator 3.0's latest features. The demo is available on VHS videotape for only $20 and may be ordered directly from Branch Always Software at the above address.

All current Gemulator users may upgrade to version 3.0 for only $30 before September 3, 1993. Users who purchased Gemulator after July 1, 1993 may upgrade for the even lower fee of only $10 with a copy of your receipt showing the date of purchase. After September 3, 1993 all upgrades are $60.

Gemulator 3.0 will be shown September 18th and 19th at the Glendale Atarifest at the Glendale Civic Auditorium. Drop by the Branch Always Software booth to say hi or to pick up your Gemulator. We'll even be taping part of our demo video at the show to get real life reactions from Atari users using Gemulator 3.0.

In North America, Gemulator 3.0 can be ordered from the following dealers:

Toad Computers
570-F Ritchie Highway
Severna Park, MD 21146
phone: 800-448-8623 fax: 410-544-1329

phone: 206-399-8700

Xanth Computers
14100 NE 20th St. #105
Bellevue, WA 98007
phone: 206-643-9697

In the United Kingdom, Gemulator 3.0 is available from:

ST Club
2 Broadway
Nottingham NG1 1PS
phone: +44 0602 410241 fax: +44 0602 241515

In Europe Gemulator 3.0 is distributed by:

ACN
Postbus 5011
NL-2000 CA Haarlem
The Netherlands
phone: +31 023 351100 fax: +31 023 361444

ACN provides Gemulator packages for the U.K. as well as versions translated into French and German with appropriate TOS 2.06 ROMs.

Users of the GEnie online service can come ask questions about Gemulator 3.0 on August 18th at 10pm during a special RTC in the Atari ST roundtable.

If you wish to call Branch Always Software, we may be reached at 206-885-5893. This is a voice number before 2pm eastern time and a fax number at other times.

2670. FORSALE: Atari SC1224 Color Monitor

My post asking if anybody played Time Lords should have been Time Bandits.
Amazing what sleep deprivation will do to a guy.

Anyhow, if you either currently play, or have played this incredibly addictive
game, please email me to discuss strategy.

Most of the levels have certain 'tricks' which make it possible to finish them
without losing tons of men. I've figured some of them out, but not nearly all
of them. Excalibur for one is driving me crazy, not to mention Darkside Dare.

```
Aggressive Party
----------------

This is an invitation "v. 0.9" to Aggressive Party. Since almost every
time parties don't have all the advertized facilities, we decided to
give you only the information which is 100% certain by this far.

Aggressive Party is an Atari (ST/TT/Falcon030) Party, but there are
also some Amiga- and PC-competitions. It is organized by Aggression
and Future Crew.

Falcon030 will be strongly visible at the party - Thanks to ION Finland.
They may also have some new exciting Atari hardware to demonstrate.

Note for Finns only: Suomalaisille on Falconista oma Party-tarjous.

Where and When?
---------------

The Party will be held in Europes biggest indoor amusement park called
Planet FunFun. It is located in Kerava, Finland, approximately 30 km
north of Helsinki. It starts on Friday, 8th of October at 16:00 and ends
on Sunday, 10th of October at 18:00. We can let foreign visitors to
enter as early as 12:00 on Friday, because usually ships from Sweden and
Germany arrive in Helsinki in the morning.

Planet FunFun is an excellent place for demo-parties. We have rented a
big hall for you and your computers and a smaller separate hall for
sleeping. There are also showers next to the smaller hall. And lots of
free parking space.

We have also an "amphitheather", in which we can show competitions and
movies on big screen. There is a couple of hundred seats, so this time
you don't have to stand to see anything.

The best thing though is: The whole amusement park is at your use. The
gadgets in it are in use only 10:00-18:00 Saturdays and Sundays, when it
is open for normal audience also, but we have some special arrangements
with its restaurants. (Which serve also alcohol...) There will be food
and soft drinks available 24h, and you can also buy proper meals at
19:00-21:00 from a restaurant called Harlin's Diner. Alcohol will also
be served at Harlin's diner at 21:00-24:00, but only for those who have
had their 18th birthday...

Also the arcade-games in it are at use 24h, as well as "Nintendo Land".

Restaurants are of course open also when the amusement park is open for
normal audience.
```

How to get there

It is very easy to get to Kerava. If you come by ferry to Helsinki and have a car with you, just follow the sings "Lahti" which leads you to the Lahti-highway (E75 or 4). Then turn off the highway at Kerava, and follow the signs "Planet FunFun". We will also put some Aggressive Party signs there.

If you come by ferry and don't have a car with you, you can come by train. Take train with label "K" and get off at Savio-station (the one before Kerava). You will stand right in front of Planet FunFun. We will arrange a transport service from Helsinki to Kerava for computers, so you don't have to carry your monitor with teeth when you walk to the station. More about that will be in the final invitation.

For those who come by plane it is also easy to get to the Kerava, since there is bus from airport to Kerava. To make your travelling even more easier we can come and fetch you from the airport if you just inform us beforehand. It will cost you only 10 FIM.

Entrance fee

Entrance fee is 100 FIM.
Lockers are available for you without any extra cost.

Competitions

There are competitions for Atari, PC and Amiga, and a music (module) competition for all computers, since protracker mod-format is so widely used accross the platforms. We didn't include information of PC- and Amiga-competitions in this text, since this goes to international Atari distribution.

In all competitions we will have a initial jury consisting of us and our sponsors, which selects the best 20 productions in every competition. Then the final jury consists of the authors of these productions.

DEADLINE for all competitions is at 14:00 on Saturday, 9th October, 1993.

Atari competitions

As our main interest is in Atari, the most of the competitions are for it.

Atari demo

Rules: Demo must work on an STe with 2 Mb of memory.

Autobooting is a must.

Demos must be previously unreleased. Released previews
do not bother us.

One group may attend with several demos.

We don't suggest you to attend with an unfinished demo, but:
The demo must be either released OR you have time to finish
it and you will get the possible prize after you have sent
us a finished version.

Prizes: 1. Falcon030 computer.
2. hardware or money (at least 3000 FIM)
3. hardware or money (at least 1000 FIM)

Atari demo competition is sponsored by Oy ION Finland, the official
Atari-importer in Finland.

Atari intro

Rules: The computer is Atari STe with 1 Mb.
The maximum lenght of the file is 40960 bytes.
The program MUST be an executable file, no autobooting allowed.

Prizes: 1. 1000 FIM
2. 500 FIM
3. 200 FIM

Atari graphics

Rules: We will not accept copied pictures. A person who tries to
attend with a copied picture will be disqualified from this
and any other competition arranged by us or our allies.
Nobody plays with Aggression.

If a copied picture gets thru our inquisition and wins
something, the author of it is obliged to return the prize
to us when we will notice the cheat.

Pictures must be previously unreleased material.

Everyone should leave min. 3 different stages of his work to
the jury, so they can make sure the picture is not a copy.
Only the last one will take part in to the competition.

Picture must be IFF, PI1 or executable.

Pictures will be shown on the STe.

We will make a slideshow of all qualified pictures.

You don't have to be an Atarist to take part - just remember,
Atari STe can show 16 of 4096 colors at 320*200 resolution.

Prizes: 1. 1500 FIM
2. 1000 FIM
3. 500 FIM

These prizes are due to change to hardware prizes. The value of
the whole prize will still not be less than this.

Falcon competitions

Falcon competitions will be held if there is enough interest.
Please contact us beforehand.

Music

As said before, music competition is for all computers.

Rules: Music must be in 4-channel protracker module format.

No executable files allowed.

Maximum length for the music is 3 minutes.

Prizes: 1. Midiman midi-to-tape recorder and synchronizer + 600 FIM
2. 800 FIM
3. 400 FIM

These prizes are due to change to hardware prizes. The value of
the whole prize will still not be less than this.

Music competition is sponsored by MS-Music Shop.

Happening at the party...

Rave! Friday 23:00-24:00, Teque-in-concert Friday 24:00->
Movies will be shown on big screen.
Various not-so-serious competitions, like hard-disk throwing etc.
We will sell party-socks and -shirts as usual.

Other rules

To give everyone a wrist-strap which indetifies you as a visitor at
Aggressive Party and also indicates whether you can buy alcohol or not,
we have to check your identify certificate. If you don't have any ID
with you, you will get "red" strap and you can't buy alcohol from
restaurants.

You can buy alcohol at our Party, but this doesn't mean you are allowed
to make trouble, neither you are allowed to drink your own liqueurs.
We do not hesitate to contact police. A little note to those who have
had a contact with police during Assembly '93... we know your names and
will not let you enter.

Also selling food, disks or hardware is forbidden. This doesn't mean
we have very high prices for these, in fact, we will sell disks on
non-profit basis, and the food in restaurants is very affordable.

More information

Write to either of these addresses:

Xenit of Aggression Qwerty of Aggression
Jan Achrenius Jussi Haapiainen
Liesitie 1 E 13 Abraham Wetterintie 11 D 40

> and been well supported.
>

I'm not convinced of that yet... so far, Darek's main products in the ST
market (correct me if I'm wrong) were Quick ST and the Atari 8-bit emulator.
The only serious commercial success he had was with Quick ST, which as
I understood, he licensed to CodeHead so he could devote his time to
working on GEMulator.

I think it is probably a fascinating piece of hardware, but I guess I'm
wondering how he is going to maintain GEMulator and how secure this
investment will be for 4-5 years from now. If Darek stops right now, I
would be able to run MIDI on it, and anything that hits hardware directly
(i.e., games) probably won't work.

I'm also thinking back on how the accident w/ Dave Small's son forced him to take time off from Gadgets to take care of family matters. I noticed we did not see a lot of SST030 and GCR expansions during that time.... and I think he has been shown to have excellent support for his users (at least the ones i've met). But things happen...

(basically, i'm leery of paying $300 for an emulator that can't quite mimic the whole 9-yards... with PC emulators for the Atari, we usually can emulate their ports... with GCR we can read/write Mac disks and even use our HDs as if we were a Mac.. i'd like to see the GEMulator in person to see if it is really doing what it claims...)

2675. forsale: 1040STf

I am thinking of getting a new STE, so my trusty 1040 STf has to go...
How much will anyone offer for it? It's a revision C (1987ish) with
TOS 1.0...

Thanks,
.s.

> influnce?

My experience in working with the ST for 5 years and seeing others in the
field. Games were popular in Europe, but in the states, aside from the
occasional pirate who had to have everything, I really never heard of
someone buying the ST for just playing games... The Amiga was better at
that... it starting coming down to music writing and playback. I mean,
the thing has built in MIDI ports... the only computer to do this as far
as I know... hense, there is a reason for that... Perhaps the 90% was
a bit high... but definately 80-85%... The ST just sucks for anything else.
The keyboard renders it useless for most business applications or word
processing. The mouse feels like shit, the graphics are so so, it's not
the fastest thing in the world... but for MIDI, it's perfect. I dunno...
it could be something I ate.

2680. Printer Help Needed!!!

Source record: 202550

My husband and I have a MegaSTe and a 386 DX40 that we want to hang a TI MicroLaser Turbo printer from. (Cuz I can get it at a discount :))
Anyway, the printer only supports HP II emulation unless we spend $300 for an Epson emulator cartridge. We're planning on using Atari Works with it.

The question is...is there any software out there that either 1) will force Atari files into an HP II format or 2) an Epson driver that we can use on the software side? (Or any info on how he can write a driver for either of these?)

Thanks in advance...

Though this looks like a great product, its flaws (which are freely and openly advertised by Darek, to his credit) are:

1. No joystick support (scratch any idea of playing most atari games on your PC).

2. Can't read some copy protected disks (ditto).

3. No MIDI (though I don't think anyone would buy it for MIDI anyways).

4. Doesn't support Spectre GCR, "at the request of Dave Small". I take this to mean that it easily could support Spectre, but Dave said "don't do it or I'll sue you". I think Dave Small is missing the boat here -- a mac emulator for the PC at this price would sell big in the PC world.

Anyways, if Darek could fix the joystick support, I'd buy one of these things.

Not all us non-MIDI folks are pirates (or even game players). I'd
imagine half the people on the net are MiNT/GCC/unix kinda people.
On the 8-bit I used to have a lot of games. On the ST I haven't
really gone that way (maybe because my monitor doesn't seem to like
ST color res' too much :-(Besides, what are the SNES, Genesis, Jaguar, etc
for then? :-)

And since Atari does not like to give out sales figures, etc, who
knows who really owns an Atari? (hmm, maybe even "Bill the Gates" :-)

>I mean the thing has built in MIDI ports... the only computer to do this
>far as I know... hense, there is a reason for that... Perhaps the 90% was

>the fastest thing in the world... but for MIDI, it's perfect. I dunno...
>it could be something I ate.

Sometimes tacos or other spicy foods do that to you :-) About the
only complaint I could make about my MSTE is the graphics - though I can
always add a CrazyDots or other board, but they're a bit expensive
at the moment. But the keyboard is fine (yes, I do remember the
1040ST keyboard, I used to have one), and I do use it mainly for
telecomm, MiNT stuff, word processing (for school mainly), etc.
I've gotten used to 16mhz, so that it my minimum speed anymore.
Besides, if a software package is really good, people will use
it regardless of the system (as I believe Syncalc was a big thing
on the old Apple II's, and their keyboard was no joy either :-)

Atari is a niche company - MIDI happens to be the main niche they've
seemed to concentrate on. Too bad the MegaSTe didn't get out in the
numbers that the ST/e's did, it's a really nice machine (and the
detachable keyboard is very nice)...

Is Atari Explorer Dead?
I suscribed a year and two months ago and have yet to get an issue!
I have placed about $1 million dollars worth of long distance calls to them
and to Atari and zilcho!
Please E-mail me with any information on how to get my money back or get
a @#!% subscription. The editor of the magazine promised me an issue in
April, guess what? Ziltch!

>"don't do it or I'll sue you". I think Dave Small is missing the boat
>here -- a mac emulator for the PC at this price would sell big in the
>PC world.

I took that to mean that to. I talked to Dave Small at WAACE this year, and that was the distict impression I got. I think there's some bad blood between the two for some reason. Then again, Derek seemed to be all but promising Spectre support and I asked Dave Small about it and he hadn't heard ANYTHING about it at the time. Spectre will not run on Gemulator without patching the code...and Dave said he WOULD sue over that, and that he probably would NOT do it himself.

Doesn't Dave make all his money from selling the Spectre Hardware and not the software? If so, how would he make money off Gemulator sales?

And it wouuldn't be the only Mac emulator in the PC world. Executor (a program for NeXTSTEP which emulates a Mac) now has a NeXTSTEP Intel and a DOS version. But it is a little more expensive..last time I checked it was $800 but that's close to the price of Gemulator and Spectre (together) and think the price has dropped since then.

All in all, Dave might be making a big mistake....but I don't think he's in it for only the $$$. I seem to remember that Apple wanted to buy part of the Spectre code off him (it ran better than the Apple orginal) and he wouldn't sell to them.

I'm working on a program that will spawn another process, and I want to maintain a "capture" of all of the activity from that process in a buffer. The problem is, I'm not sure how I should go about doing this... I guess I need to Fforce() stdout and stderr to output to a new file first, but how can i also get everything the user is typing via stdin?

2688. Atari ST software (games) for sale or trade

Newsgroup: comp.sys.atari.st
Date: 1993-08-16 22:34:52 UTC
From: griffin@techbook.techbook.com
Message-ID: <24p22c$1hs@techbook.techbook.com>
Source record: 202459
Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other,rec.games.misc,bit.listserv.games-l,pdx.forsale

I have a lot of Atari ST games I'd like to get rid of (I no longer have an ST). Make an offer for any amount of them, or offer a trade -- I am interested in trading for IBM games, IBM joysticks (looking for a Gravis in particular), and maybe some RPG stuff (pen-and-paper variety). All software is as-is (though I might be able to test them, given time).

Alternate Reality: The City - city based RPG, similar to Bard's Tale
Bard's Tale - city and dungeon based RPG, of the hack n'slash variety
Chessmaster 2000 - old but good computer chess game
Drakkhen - difficult but great RPG -- good graphics
Deep Space - space shoot-em-up
Dungeon Master - great dungeon hack n'slash 3-D RPG
Fiendish Freddy's Big Top'O Fun - circus games (Olympic-style)
The Final Battle - RPG
Golden Path - martial arts adventure type - pretty decent
Guild of Thieves - good text adventure with graphics, like The Pawn
Heroes of the Lance - AD&D arcade/RPG
Karate Kid Part II - martial arts fighting game
Lancelot - another text adventure with graphics, fun
A Mind Forever Voyaging - superb Infocom text adventure
Moebius - Origin RPG
Music Studio - not exactly a game, but fun to play around with
Ninja Mission - martial arts fighting game
Oriental Games - great martial arts game
Phantasie - old but fun RPG by SSI
Phantasie III: The Wrath of Nikademus - good RPG by SSI
Populous - the great world-building "god" game
Prime Time - fun game, you control the TV stations
Renegade - martial arts fighting game
Rings of Zilfin - RPG by SSI
Silicon Dreams - graphic/text adventures (3)
Sinbad and the Throne of the Falcon - Cinemaware movie-like game
Star Trek: The Rebel Universe - Star Trek game, not bad
Test Drive - drive in great fast cars, driving simulator
Ultima IV - my favorite Ultima, great RPG
War in Middle Earth - Tolkien-based medieval war game
World Games - Epyx Olympic-style multi-player game
World Karate Championship - martial arts fighting game

I think that's it. Let me know if you're interested. Thank you.

>Figures. What can it do non-interlaced?

I just picked up the demo version (which is now on atari.archive, in
Falcon/sblaster.zip), which will do 884x512 (or was it 864? don't remember)
noninterlaced, 59.4 hz refresh, 16 color. I haven't tried many of the other
modes yet; the demo is quite limited in the number of resolutions you can
achieve (since it lacks the hardware to provide the 32 MHz pixel clock).
In monochrome you can get 672x496, pretty much the same as the old Overscan
mod on an old ST. However, it looks quite nice, very easy to use.

2699. What's wrong with my ST? Loose chips?

Newsgroup: comp.sys.atari.st
Date: 1993-08-17 04:29:31 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <24pmrb$31p@usenet.INS.CWRU.Edu>
Source record: 202467

Hi, I've been having problems with my ST.

For one, sometimes when I'm doing something, the screen blurs (color) and weak looking bombs spread across the screen. It is happening A LOT more often now then it ever did before.

When I turn it off, I wait about 5 minutes and then it gives me 20 bombs across the screen. Or it gives me 3 bombs across the screen. One time it gave me rainbow color lines across the screen.

I then decided to turn it off and shake the computer a little (nothing major) and turned it on. The software loaded right up. I didn't leave it on much this time so I don't know if it will give me a blurry screen again with bombs.

What I'm wondering is if loose chips could be the prpoblem? The computer has recently been placed where there is vibration. This is only temporary, but the problem now exists.

Please don't let me theory of loose chips shoot down your theory. Let me know what you think might be the problem or if it has ever happened to you.

Thanks.

You odds of a game working on GEMulator are infinitesimally small.

How can you expect a game to work on an emulator when 90% of them
don't even work on a TT, and heaps not on the MSTe!

GEMulator is for GEM applications only. Take a look at the list
of compatible software in the original posting.

Loose chips is a problem that's plagued my ST for years. If I've recently moved the computer from one location to another, or if the temperature gets too extreme (either too hot or cold) I find that my ST sometimes forgets that there's a disk drive attached. Gem boots up okay, but refuses to recognize that it has a disk. When that happens I take some advice a technician friend once gave me and open up the computer and push down on every chip inside the thing. I push carefully but firmly, making sure every chip is securely seated, then put it back together. Sometimes it takes two or three treatments of this (if the computer has been running a while it helps to let it cool off first) to work, but thus far I've brought my computer back from the edge of oblivion more than a dozen times this way. Quite fortunate, since professional service or replacement is beyond my means right now.

I don't know if loose chips is what your problem really is (shaking a computer is not something I would do, personally) but you could try this the next time the system messes up and see what happens there.

Bollocks. Show me one program that will run on GEMulator but
not on a TT or Falcon. Only the most WELL BEHAVED programs
(which fortunately, are usually the good ones anyway) will
run on GEMulator.

>I know they're pictures and they seem to be smaller, a lot smaller than
>gifs, but are they as good in quality?
The quality of the jpeg-pictures is still good but it is a loosy algorithm because some information will be dropped.
Normally nobody will recognize the difference, because the information dropped are high frequent details (look for fast-fourier-transformation)of the picture a human can't see.
It depends on the grade of compressing if you can see errors in the picture.

2708. WinWord compatible ST Wordprocessor

Newsgroup: comp.sys.atari.st
Date: 1993-08-17 11:51:19 UTC
From: sblagdon@axion.bt.co.uk
Message-ID: <24qgnn$8io@zaphod.axion.bt.co.uk>
Source record: 202483

All,

Does anybody know of a Wordprocessor (PD hopefully) for the Atari ST that
is compatible or at least partly compatible with Word for Windows.

Any help appreciated,

Shaun

2709. Atari ST software

Newsgroup: comp.sys.atari.st
Date: 1993-08-17 12:07:55 UTC
From: winters@access.digex.net
Message-ID: <24qhmr$q69@access.digex.net>
Source record: 202484

Well, I finally got to get my hands on an ATARI ST after all these years,
seeing a few friends have lots of fun with these machines. A kind soul
who had a 1040 ST sitting in his closet with lots of software wanted to
get back to Atari's roots and get his hands on an 8-bit machine, so I
traded him most of my 8-bit gear for his ST, color monitor & DEVPAC ST
assembler (version 2) from HISOFT, HISOFT FORTH, OSS Personal PASCAL,
and lots of other stuff. The FORTH and DEVPAC assembler are fantastic, but
I need to acquire a decent C compiler to use in my current floppy-disk
environment. Eventually, I will purchase a hard-drive for it, but for
now, it's a floppy-only (ugghhhh!! :-)) I just sent away for
a public domain C (5 bucks!), but would like to purchase a C, if this
turns out to be a dog. Does anyone know of a good, small C either in
public domain or commercial that does not cost an arm or leg? I am
considering canning using C and just stick with the FORTH and assembler,
since the C compilers I have seen on the Atari so far, don't even come
close to the ease of use, I have seen in these two packages. I have
tried, unsuccessfully so far, to get LASER C working on my machine.
It has 1 MB memory. I got the disks and manual with my machine, but
I am getting "Not enough memory" errors when trying to boot the sucker
up and other weirdness, but I might be doing something screwy....
In any event, I REALLY like the idea of only having to worry about using
one disk in a language development environment, until I get a hard disk.
I am quite surprised that you can actually get by with 1 floppy drive on
an ST - I have heard the old stories where people say that this is the only
machine where you can get by with this kind of cheesy setup!! Even 2
floppy drives on a PC would be impossible.... And of course, with Windows,
you need to purchase tons of memory and disk space.... The Atari ST
Gem implementation of Windows is fantastic and holds up against any other
machine I have used. My Mac at work is slick, but costs a hell of a lot
more than a Atari ST, where even a few years ago, if you got one of the
last ones "new" at a store, it would still only cost half the price of
a Mac!!! I know this is a silly wish, but I really wish Atari would
revive the old ST line, since I personally, don't want to spend a
thousand bucks to purchase a Falcon for a home machine to just hack around
on.... Whatever happened to the home user? I am hanging on to my
last Atari 800 machine (and an 850 drive) forever!! They are the last of
a dying breed - cheap machines you can experiment on at home, without having
to buy a PC clone and all the headaches related to it, simply to be able
to run some games and program in. I heard PCs are getting much simpler
to be able to configure (and watching some friends do this, seems to
make this seem true), but I got a real kick out of plugging my newly
acquired ST in, spending 2 minutes looking at the Atari manual and
running a program. My only complaints with this machine are the
sucky joystick/mouse ports (who in the world designed these????) and

the junky keyboard (my 800 keyboard blows this away!!!). Any advice on C compilers for the Atari ST would be appreciated. Also I would be interested in hearing from you about what you think of DEVPAC ST assembler and the HiSoft Forth interpreter.

Long live Atari!!!! ----- Mike Winters winters@access.digex.com

> I know they're pictures and they seem to be smaller, a lot smaller than
> gifs, but are they as good in quality?

They definately are. In fact far better than GIFS most of the
time. It depends on what the picture is. If it is a True
colour picture such as that from a photo JPEG works extremely
well. However if it contains large blocks of one colour then
the quality will probably deteriate. Hence never take a GIF
and convert it to JPEG, it will look worse.

As far as I've heard there is little that is less cumbersome than Cubase
for Windows. I wouldn't be surprised if it was faster and more reliable
when run through the GEM emulator. GEM is not that bad---it is fast
because it's simple. And, doesn't the GEMulator run without windows as
well?

I don't agree. As someone has stressed on this group before, people are
still happily using Ataris from 1985 but PCs from 1985 have all gone through
the shredder.

>Unless the falcon really takes off big, my way of upgrading from the

Guys, guys, what about the TT? If you'd buy a 486 and a TT now, I want
to bet you'll want to replace the 486 sooner than the TT. Same story for
Macintoshes. If there is any type computer that lasts *short* then it is
a DOS machine. (Note: MACHINE not SYSTEM).

I suppose that if people stick atari disks into a PC they usually don't
own the PC so they'll have to work with the OS installed on that machine.

Christine, I cannot vouch for Atari Works since I don't own a copy, but most
any recent word processor or drawing package will surely have a HP printer
driver included. Don't sweat too much about the HP "II" version as from my
experience a standard HP driver works with most anything that is HP compatible.

I also know from experience that 'Crossword Creator II' includes a printer
driver for both draft and final quality printing on HP compatible printers.

I use ps2form.tos to format disks for use with PCs. I have never had any problems with the disks working, even on PS/2's and NEC PCs (which are known to sometimes be unable to read disks formatted on clones!). It is available from atari.archive.

2723. Atari Corporate History - 4

Newsgroup: comp.sys.atari.st
Date: 1993-08-17 16:02:51 UTC
From: etxansk@garbo.ericsson.se
Message-ID: <etxansk.745603371@garbod26>
Source record: 202498
Cross-posted to: rec.games.video.classic,comp.sys.atari.8bit,comp.sys.atari.st,alt.games.lynx

I've updated the the Atari corporate history list. As I've stated before, my intention is to write a dictionary (in Swedish) that covers important events in the history of video gaming and home computers. While I was doing this, I made a separate document describing Atari's history.

Btw, the emacs editor was about to destroy this revision of the list, I hit the keyboard by mistake and I may have damaged something. I can't find any error caused by this accident, but if there is something wrong with the list, I'll start using vi instead.

I've removed the arcade game list, and I haven't decided yet how to handle the description of the company after it was split. There may be a need for separate lists.

If you can complete the information, the times of certain events are still not accurate, I'll appreciate that. Reply on the net or via email.

1972: -Atari Inc, was founded by Nolan Bushnell. Originally, there was a company named "Syzygy" that both manufactured and operated games. This company was split, and a new manufacturing company was formed by Bushnell. Ted Dabney kept Syzygy's operations side and the name, Bushnell's new company was called "Atari".
1972: ???-The Pong game was released.
1974: ???-Pong was released as a home system.
1976: ??? -Nolan Bushnell sold Atari Inc to Warner Communications this year, but continued his work for the company.
1977: -The Atari 2600 was released. It was based on MOS Technologies' 6507 CPU running at 1.19 MHz. The 2600 offered a resolution of approximately 160 * 200 pixels and a 128 colour palette. It had 128 bytes of RAM, the ROM address space allowed cartridges up to 4 KB. Game sizes were typically 2 KB or 4 KB. Some cartridges used bank-switching for access to more than 4 KB ROM space, the biggest known games are 8 KB.
1978 ??? -Atari released there first pinball machine.
1979: -The Atari 400 and Atari 800 computers were released. They were 6502-based 1.74 MHz machines with several ANTIC (chip) graphics modes from a 40 * 25 text mode up to 320 * 192 pixel in monochrome. Using lower resolutions, it was possible to have 128 colours, or even 256, in a special CTIA (chip) mode. Audio was four-channel, based on analog synthesis in the POKEY chip. The computers had inofficial names "Colleen" and "Candy".
-Nolan Bushnell left Atari Inc.
???-The production of Atari pinball games was discontinued.
1982: -The Atari 1200XL computer was introduced with specifications similar

to the 800s, except that XXX.
-The Atari 1450XLD ??? was introduced with specifications similar to
the 800s. The 1450XLD had a built-in disk drive and XXX.
1983: -The Atari 600XL and 800XL computers (the XL series) are introduced,
with specifications similar to the 800's. XL replaces 400/800. The
800XL had 64 KB of RAM, the 600XL had 16 KB. The GTIA (graphics)
chip replaced CTIA, and among other things it offered better timing
for player/missile ("sprite") graphics.
-The Atari 7800, developed by GCC Corp, was shown at the Winter CES
in Chicago.
1984: -Jack Tramiel was forced to leave Commodore. He bought Atari from
Warner Communications. Atari Inc was split into Atari Corp (consumer
products) and Atari Games (arcade division). Amiga (a company) had a
deal with Atari, but it was inhibited at this time, and the Lorraine
(later Commodore Amiga) computer was bought by Commodore. The
AtariTel division was sold to a Japanese company, ??? Matsushita.
1984: ??? Atari announced their SARA chip at the CES, the new chip allowed
for 2600 titles with 16 KB of ROM memory.
1985: -The Atari 520ST computer was introduced. It's a 68000-based 8 MHz
computer with 512 KB RAM, graphics modes from 320 * 200 pixels
in 16 colours from a 512-colour palette, up to 640 * 400 on a
monochrome monitor. Audio is created by a three channel sound
chip using fairly simple analog synthesis. Digital Research's
graphical user interface/operating system GEM is included. The
ST computer has a built-in MIDI interface.
-The Atari XE series, 65XE and 130XE, compatible with the 400/800/XL
series, was introduced.
1985: ??? - The Atari 5200 video game was released. The 5200 was based on
existing XL (computer) technology.
1986: ??? -The Atari 7800 video game was released. It was 6502-based and
could run 2600 games, but it was also a vast improvement over the
2600, with impressive video capabilities in ??? colours and
??? * ??? pixel graphics. Sound was, however, the same as in the
2600.
1987: ??? -The Atari XE/GS video game, based on the Atari XE computer
series, was released. It could run old Atari 8-bit computer
cartridges, a few new games were also released. A lightgun with
some shooting games was released for the XE/GS.
1988: ??? -Atari bought the Lynx from Epyx, the company that also developed
it. The Lynx is a 6502-based (4 MHz) portable colour video game with
a built-in 3.5" colour LCD screen. Graphics resolution is
160 * 108 ??? pixels in 16 colours out of 4096. The graphics engine
supports scaling of objects. Sound is four-channel mono. Lynx
cartridges can hold up to 256 KB ??? of code, and the machine's
internal RAM size is 64 KB.
198X: ??? -The Mega ST series was introduced. It was based on ST
technology, but graphics handling was improved with a blitter chip.
198X: ??? -A palmtop PC computer, the Atari Portfolio is released. The
Portfolio was developed by XXX in the UK.
198X: ??? -The 68030-based 32 MHz Atari TT computer is introduced. Sound

and graphics are similar to the STE's, but there are also certain
improvements done in the graphics area. The TT's highest resolution
is 1280 * 960 pixels in monochrome.
198X: ??? -A portable ST computer named STacy is introduced. It's
specifications are similar to the original 520ST computer's. STacy
has a built-in monochrome LCD screen.
198X: ??? -A new version of the Lynx, "Lynx II", is released. The only
improvement (with regard to internal technology) over the old Lynx,
the "Lynx Classic", is that the headphone jack now features stereo
sound.
1984: -Jack Tramiel was forced to leave Commodore. He bought Atari from
Warner Communications. Atari Inc was split into Atari Corp (consumer
products) and Atari Games (arcade division). Amiga (a company) had a
deal with Atari, but it was inhibited at this time, and the Lorraine
(later Commodore Amiga) computer was bought by Commodore. The
AtariTel division was sold to a Japanese company, ??? Matsushita.
1984: ??? Atari announced their SARA chip at the CES, the new chip allowed
for 2600 titles with 16 KB of ROM memory.
1985: -The Atari 520ST computer was introduced. It's a 68000-based 8 MHz
computer with 512 KB RAM, graphics modes from 320 * 200 pixels
in 16 colours from a 512-colour palette, up to 640 * 400 on a
monochrome monitor. Audio is created by a three channel sound
chip using fairly simple analog synthesis. Digital Research's
graphical user interface/operating system GEM is included. The
ST computer has a built-in MIDI interface.
-The Atari XE series, 65XE and 130XE, compatible with the 400/800/XL
series, was introduced.
1985: ??? - The Atari 5200 video game was released. The 5200 was based on
existing XL (computer) technology.
1986: ??? -The Atari 7800 video game was released. It was 6502-based and
could run 2600 games, but it was also a vast improvement over the
2600, with impressive video capabilities in ??? colours and
??? * ??? pixel graphics. Sound was, however, the same as in the
2600.
1987: ??? -The Atari XE/GS video game, based on the Atari XE computer
series, was released. It could run old Atari 8-bit computer
cartridges, a few new games were also released. A lightgun with
some shooting games was released for the XE/GS.
1988: ??? -Atari bought the Lynx from Epyx, the company that also developed
it. The Lynx is a 6502-based (4 MHz) portable colour video game with
a built-in 3.5" colour LCD screen. Graphics resolution is
160 * 108 ??? pixels in 16 colours out of 4096. The graphics engine
supports scaling of objects. Sound is four-channel mono. Lynx
cartridges can hold up to 256 KB ??? of code, and the machine's
internal RAM size is 64 KB.
198X: ??? -The Mega ST series was introduced. It was based on ST
technology, but graphics handling was improved with a blitter chip.
198X: ??? -A palmtop PC computer, the Atari Portfolio is released. The
Portfolio was developed by XXX in the UK.
198X: ??? -The 68030-based 32 MHz Atari TT computer is introduced. Sound

and graphics are similar to the STE's, but there are also certain improvements done in the graphics area. The TT's highest resolution is 1280 * 960 pixels in monochrome.
198X: ??? -A portable ST computer named STacy is introduced. It's specifications are similar to the original 520ST computer's. STacy has a built-in monochrome LCD screen.
198X: ??? -A new version of the Lynx, "Lynx II", is released. The only improvement (with regard to internal technology) over the old Lynx, the "Lynx Classic", is that the headphone jack now features stereo sound.

I'd love to run gemulator under SunPC/SoftPC, but I think there's a catridge/ROM problem here (I'm sure some people are doing it (or wil be doing it, though)).

Scott

I am currently using a JRI Simm board in my 1040ST and so far haven't had any problems in it for several years now. With the revision board I had though, it did require that I solder all the lines into my motherboard (other opt is to solder a logic cable with a "chip like" connector piggy back onto another chip with a couple lines still). I didn't like the idea of pressing anything onto the MMU socket as anything pressed in usually has the problem of falling out, hence I went JRI. If you want to add an "easy SIMM uprade", I don't think there's such a thing. Consider what it is you're really doing here.

In either case, I can still get my old ST config back with a bit of un-soldering wires and re-soldering a few caps back into place. Unfortunately, I can't/won't use my ST with 1 meg anymore since I've become hopelessly spoiled rotten! The ICD AdSpeed CPU (16mhz) is definately another yippee (and another solder monster). Cruizin!

TOS 1.04 / NeoDesk / Cubase 3.01 / Warp 9 (mouse f/x off) / UIS III!

PS. I actually do have a 1 meg STe, but it runs my bbs off-site.

>because it's simple. And, doesn't the GEMulator run without windows as
>well?

GEMulator does not (currently) support MIDI... therein lies the problem...

So the only options for MIDI sequencing if you buy one is/:

1) By a PC sequencer and port all your old files over
2) Continue to use your current ST in conjunction with the PC

So it seems (from my MIDIot point of view) to be a bad move for me... i can
see where a DTP user might want to migrate, as DTP is:

1) heavily GEM based
2) not timing critical
3) and usually can take advantage of new screen modes

Honestly i hope there is no such beast...

If you need something with the same look and feel as W4W you
might try Tempus Word (junior, student, pro, 300 to 600 DM?) by
CCD Eltville, Germany

It realy feels like W4W, comes with some fonts has a spelling
corrector (at least german), online help and is easy to use.

Of course the shortcuts are different but you can even
configure the stupid windoze shortcuts if you like.

The performance on a MEGA ST is better than W4W on
an 386 DX 33 Mhz.

Tempus Word is able to import and export RTF (Rich Text Format)
which is supposed to be understood by W4W, not tested.

The problem is: It doesn't like MiNT
(At least my Version doesn't and it is from Dec 92 v. 2.05
if i remember right)

Source record: 202407

Hey, that's great!

Now i can use SoftPC on my WS (HP9000/425) (68040, 25 Mhz)
and run Gemulator on this SoftPC.

Thus i don't need to port MiNT to this machine, which is
a really hard job!

I will get the performance of a 2 Mhz ST, but 8 MB RAM!

Well, maybe i'm going to buy a FALCON instead.

Sorry, couldn't resist

> the 800s. The 1450XLD had a built-in disk drive and XXX.

The 1450XLD, if I am not mistaken, also had a built in 300 baud modem and a speech synthesizer... The 1400XL was supposed to have a 300 baud modem and speech synthesizer, but no disk drive...

>1985: ??? - The Atari 5200 video game was released. The 5200 was based on
> existing XL (computer) technology.

Uh, no... the 5200 came out in mid-late 1982... I got one in the summer of 1983 (Back when Super Breakout came with it! ;) And the base system is a 400 computer with no keyboard..

>198X: ??? -The Mega ST series was introduced. It was based on ST
> technology, but graphics handling was improved with a blitter chip.

This was 1987... TOS 1.2 was made for the Mega's and it has a date of 1987 on it..

>198X: ??? -A palmtop PC computer, the Atari Portfolio is released. The
> Portfolio was developed by XXX in the UK.

88-89? It was developed, I believe, by a company called DIP (The MS-Dos clone was called DipDos...)... I may be wrong there, but it was a short name LIKE Dip, if nothing else...

>198X: ??? -The 68030-based 32 MHz Atari TT computer is introduced. Sound
> and graphics are similar to the STE's, but there are also certain
> improvements done in the graphics area. The TT's highest resolution
> is 1280 * 960 pixels in monochrome.

I don't think the TT actually came OUT until mid-1990, but I'm not sure..

>198X: ??? -A portable ST computer named STacy is introduced. It's
> specifications are similar to the original 520ST computer's. STacy
> has a built-in monochrome LCD screen.

88?

>198X: ??? -A new version of the Lynx, "Lynx II", is released. The only
> improvement (with regard to internal technology) over the old Lynx,
> the "Lynx Classic", is that the headphone jack now features stereo
> sound.

This was 1991 I think... Also, the system includes a backlight on/off switch,
which extends battery time...

Hope this helps! Feel free to dispute me!

2736. Atari MegaSTe for sale

Newsgroup: comp.sys.atari.st
Date: 1993-08-17 22:15:16 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1993Aug17.221516.14295@newshost.lanl.gov>
Source record: 202409
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.8bit,misc.forsale.computers.other

```
**********************************
*** Atari MegaSTe 4/50 for sale ***
**********************************

16MHz 68000 cpu
4Mb RAM
50Mb internal hard disk drive
one 3.5 inch internal floppy drive
one 3.5 inch external floppy drive
separate programmable keyboard
VME expansion port
SC1224 color monitor
SM124 mono monitor
mouse and all cables, manuals, etc.
200+ disks of PD/shareware software w/storage boxes
Plus some commercial software (email for info)

Got to make room for some new hardware and in order to maintain marital
bliss, at least one of my Atari computer systems _has_ to go.

Overall, this system has proven to be very reliable and it provides a
considerable performance increase over a standard 8MHz STe. In many ways,
I find it preferable to the Falcon030... it's nearly as fast, easier to
expand, much more compatible with existing software and has an excellent
keyboard (all IMHO, of course).

I will consider all serious and reasonable offers. Payment can be
arranged a number of ways to include cashiers check, money order, cash
COD, or even M/C or Visa if you prefer.

If interested, forward your questions and/or reasonable offers to me
via email at hutch@ilmen.lanl.gov and I will get back to you. Or you may
phone me at (505)665-3665 (days) or (505)662-7236 (evenings), MST.

Thanks,

I ftp'ed it from aa, and tried it on my TT and it just froze up, even when
I clean booted w/no auto prgs or acc's.

Has any other TT owners gotten it to work? BTW, I have TOS 3.01.

>change?

Well, I think that if sheppard_r@. . . wants to try to say that the
ST is no good because it doesnt have C-Kermit 189, he is a fool (and
should go to the advocacy group anyhow - this is a serious newsgroup)

However, 189 is MUCH improved over 188. True, thre version change
number is small, but 189 allows a faster connection when both sides are
using 189. The fast mode is FASTER THAN Z-MODEM. (Yes, faster than
Z-Modem). As you probably know, 188 is as slow as all older kermit
versions. (i.e. very damn slow. About have x-modems speed it seems
without actually timing it).

But, I am sure I could download the source for 189 and compile it for
an ST.

Funny thing is that I was experiencing the same type of problems with my
1040 STF. I believe that it was the power supply problem. At times I had
to use a hair-drier to warm up the part where the powere supply is seated
and then try to turn the machine on.
When I got my Mega STE 4 I put my old 1040 STF into my closet. After about
a month I took it out to see if it would work. Couldn't quite believe when
it did. I must twisted the casing somehow and whatever was giving me the
problems righted itself. Try checking the power supply. How about you try to
hook up an external one.

Woj.

>1985: ??? - The Atari 5200 video game was released. The 5200 was based on
> existing XL (computer) technology.

I have in front of me the December 1982 issue of 'Videogaming Illustrated'. Page 9, under the title 'The Emperor Strikes Back' they write: '...this is the month the long-awaited Atari 5200 goes on sale. Retailing for $299, the unit offers graphics which are comparable to those of Intellivision and Colecovision, and sound effects to match.' The article also mentions that games are expected to cost from $31.95 to $39.95.

I think I heard previously on the net that 1985 was the *last* year that the 5200 was made.

BTW I have a few issues of 'Videogaming Illustrated' which sometime in 1983 became 'Videogaming and Computergaming Illustrated'. The articles are interesting and seem well-written. One of their reviews raps Decathalon for being too hard on joysticks :-) Anyone know what became of this magazine or if it still exists in some mutated form?

2741. Falcon partition is hosed

Newsgroup: comp.sys.atari.st
Date: 1993-08-18 01:40:25 UTC
From: bill@main.morris.org
Message-ID: <24s1a9$cif@c3po.jvnc.net>
Source record: 202416

It seems that my E: partition is hosed, and the few things
Ive tried didnt work.
First, running HDX to try to zero the partition reports
something to the effect 'boot block is bad, may have been partitioned
with another utility'.
Of course, this isnt true. As a matter of fact, its pretty
much the first time Ive tried to use the E: partition since Ive
gotten the machine.
The other partitions work fine.
On the off chance, I tried to run ICDs Cleanup ST, but that
didnt even load...
Any ideas, outside of reformatting the whole physcial drive?

Thanx

Why? There would be almost ZERO applications that you could use
the joystick with anyway, so I don't see why Darek would try to
support it (except to made it look better in advertisements).

Also, the idea with GEMulator is that you use the PC's hardware:
harddrive, sound, video, mouse. But PC joysticks are not Atari-style
ones, so that would all require additional hardware.

I'm interested in learning Objective C, and I just got the new 2.4.2 version of GCC, but it seems to only have the basic compiler in the archive and not the c++ or objective C compiler. Objective C is also supposed to come with an interpretter - one of the many reasons why I want this beast!! I did not see an interpretter in the archive,

I got the mgcc242b.zoo archive from the MiNT section. Where do i get the things that I need? Should I get the larger (> 1MB which is gonna be hard to get with BART!!) archive in the GCC section for TOS? Will this archive have the things I want? Its exactly the same I think (same version number!!!). Will I be able to mix-n-match the base-relative parts of the compiler from the MiNT directory with the non-base-relative peices from the TOS archive??

Does the Objective C interpretter even exist for GCC? Can it be used for standard C? Also, where can I get the Objective C specific libraries?

Has anyone created any sort of Objective GEM Library?? Something like MacAPP or the NeXT Interface Builder would be nice. Hehe .. maybe we can talk Ian Lepore into porting GEMFAST to be an object library :-)

Please E-Mail responses. I don't know when I'll get back on the net again. Thanks a bunch!!

I agree, we MUST have a FALCON030 Newsgroup. Many may say that there wouldn't be that many messages there, but if you look at it, most of the messages are about Falcon030. What would happen is alot of traffic on the FALCON030 newsgroup and less traffic here on ATARI ST. This is the natural progression of things, just as when the ATARI 8-bit users were saying they didn't need an ATARI ST newsgroup. :) The ST will fade away soon, and the Falcon must take over.

PowerZone, side 234 on Sky One, 17/8-93

-/-

HEY WHAT MACHINE DO I BUY? - ATARI?

We have spoken about 3dO, Amiga 32, CD Rom but what of Atari. The Falcon (that's their new flagship computer) does not seem to be doing much. The specs on this machine sounds great but with only UK sales of 7,000 the user base is nearly non existent. So enter the JAGUAR, not a car but a 64 bit console machine also coming from Atari.

What with 8 bit machines, 16, 32 and now 64 when will it ever end. It is alright to say having the fastest car in the world but no good with a speed limit of 70 MPH. The same analogy can be said of a 64 bit machine, it may be fast, have zillions of colours but without either a user base of software support it may as well not be there.

The Jaguar has the support of companies like US Gold, Elite and Ocean and already games such as Human and the brilliant shoot-em-up Raiden are near completion so who knows Atari could be back in the limelight again. One spin off with Jaguar's development is that there should be more Falcon games around.

Talking about the Falcon did you know that you can hook a CD ROM up to it and run the Kodak Photo CD disk!

-/-

Typed in by Rickard Troedsson. I've checked this over and over again, all the typos and the bad english comes from the Sky One employee.

I heard that if you make your own plate, and turn it 90 degrees, a 3.5" will
fit nicely in the Falcon ..

I will try it when I get mine .. (tomorrow or the day after .. ahh ..)

This is a known bug in the older Atari HD drivers. The latest ones (Cant remember the number off hand) fix this bug. What happens is that when a partition fills up, it overwrites the first cluster of the next partition. In you case I'd guess drive D filled up and trashed E: All I can suggest is a backup & repartition it. Then get the new version of the drivers from Atari or the net. The fixed version is probably a couple of months old now.

>over.

No way what ever, the FALCON is a DEAD computer, only 1000-2000 sold world wide
I would think there are more 'TT's' than Falcons out there and we don't have a
'TT' group...

Just live with the facts that the FALCON is Dead, it has a -100% performance
rating, has far to many Bugs, no True colour in High res modes, has Big
problems in Interlace modes, screen comes up scrambled very little software
support, and I could go on and on...gee and the Price, what a rip off..!!

Facts not Fiction...!!!!

Roger.................. sheppard_r@kosmos.wcc.govt.nz

Well thats a Falcon for you..!!!

Well from what I have read here and else were you need HDX 506 or 508 or what ever, this Bug was claimed to be fixed with HDX504, but never..

I have not seen the latest version posted to the Net yet, only HDX 504, so may be some good Atari Falcon user could post the latest version to the Net some were..

Ataries support on GEnie is now none existence, and this is there main Support System, there is no Xcontrol panel 1.31 on there or the latest HDX software, I do think Atari should be getting its finger out and Supporting its users..

TEMPUS WORD (only availabel in German language) is a word processor which
reads and write Microsofts RTF format and has about the same functions as
Word for Windows. It's availabe from CCD, Germany in three different
version, the cheapest one for 200,- DM.

SCSI-Tool should be able to create a new file system on the damaged partition (it's
a commercial program from Hard&soft, Germany).

>Thanks. Below is the source file...

Well, one of them anyway. I should imagine that there are also files called
emaxio.c, rwdisk.c, frmtdsk.c and screenio.c judging by the #includes.

Don't post the whole thing here though - email it to anybody who thinks they
can help.

It doesn't look too hard to convert, assuming rwdisk.c uses the PC's BIOS
rather than directly accessing some strange disk controller. I'll try to
help if no-one else can.

Add to that around 7000 in the UK (Can't remeber where I heard the figure, but it sounds correct...)

Obviously you've never seen a falcon, otherwise you'd realise that most of these rumours are completely unfounded.There are no problems with "scrambled screens" that I've seen. Nearly all my old ST stuff runs on my falcon, most of it runs faster. Most of the early bugs in the OS have been patched. Hell, I like my falcon, and wouldn't swap it for anything (apart from perhaps an SGI workstation...)

Oh well, that's another name for my kill file.

>Atari files into an HP II format or 2) an Epson driver that we can use on the
>software side? (Or any info on how he can write a driver for either of these?)

I've recently been using Atari Works on my Falcon (great program by the way, it's really easy to use). I've gotten great printouts on an HP LaserJet Series II using the generic "HP LaserJet" driver which comes with SpeedoGDOS and Atari Works. If your printer can emulate an HP LaserJet (I imagine it doesn't matter what version of LaserJet it is, at least not a whole lot), then you should be able to use the LaserJet driver. I've been able to get really great results from Atari Works and SpeedoGDOS (it even looks pretty good on my 9-pin dot matrix, albeit crummy compared to the laser).

Also, just a general comment : if anyone out there has heard the hype about Atari Works and is wondering if it's worth buying, believe me it's as good as its cracked up to be! This is in my IMHO of course but it's a very well-designed program and is just a breeze compared to anything else I've seen for the Atari. I'm very impressed with the program, and SpeedoGDOS is very nice as well -- it's fast and produces good output on a wide assortment of printers. My advice is : you _need_ this program... :-)

You should be so lucky. We're forced to use WPerfect for Windows, which really sucks! (Can we have a "my wp is worse than yours" thread???)

More seriously, try Redacteur 3, which exports RTF. Available in the UK from the ST Club.

You mean he's not in there already?

I don't think anybody has countered his "overpriced" claim. The Falcon's
price is a breakthrough for something with a DSP and stereo 16-bit 50KHz
sampling/playback.

However, I have got to agree that the Falcon doesn't look very healthy at
the moment (The ST sold nearly 200000 in the UK one year) and it would be
unwise to create a newsgroup for it until more have been sold.

I think there is a danger that Atari might go back to it's roots if the
Jaguar proves a success and drop the Falcon altogether.

There are probably plenty of them. There are pieces of code that will break on '030s due to caches, MOVE SR, and stack frames at least. Maybe more. If these programs are well behaved in other respects, they would probably work on GEMulator.

These instances obviously won't be as popular as the programs that don't work on GEMulator, but they will exist.

Source record: 202253

Just some random thoughts on the Gemulator rantings and ravings of late...

IMHO, just because someone uses a PC as well as our beloved Atari is little justification to denounce them as "traiterous." Many people simply _need_ to use non-Atari software due to work or school requirements. And some of us (myself included) use and actually enjoy _multiple_ platforms, appreciating each for the certain advantages they offer. Atari makes great computers, no doubt, but they are NOT the be-all, end-all of computerdom. Then again, neither is the PC, Mac, Amiga, ... ad nauseum.

Unfortunately, most people simply cannot afford to own multiple computers. Now if someone could show me a single "box" that would allow me to run my favorite Atari, Mac and PC applications with little or no performance or compatability concessions, all at a reasonable price, I would be one happy camper and I wouldn't care less about WHO made the box. I can dream, right?

Gemulator, Spectre GCR and soon, Power PC, are all steps in that direction. The tools you use to get a job done are not important... it's the results! Those who can resist being blinded by computer brand name "religion" face a very bright future, indeed. Remember... you read it here first. :)

Hey, I'll fight anyone to be first in line to sing the praises of Atari. But in so doing, I'm not about to sacrifice my common sense to the almighty Fuji.

Cheers,

2779. Re: SIMMs in an ST?!?!

Newsgroup: comp.sys.atari.st
Date: 1993-08-18 16:42:47 UTC
From: mcookson@flute.calpoly.edu
Message-ID: <1993Aug18.164247.146462@zeus.calpoly.edu>
Source record: 202251

The JRI SIMM board is not too bad. In most cases, it has a ribbon cable with a connector that solders on to one of the RAM chips and a ribbon cable that plugs into the shifter. (Also gives you 4096 colors if you have 2 shifters). Then it has 8 additional wires that go to the MMU. Instead of forcing it into the MMU, you solder these (preferable to the underside of the circuit board).

I did this upgrade to a 1040, and then decided to move it to my 520 (my 1040 is a little flakey, but a stupid problem had be convinced than the 520 was not working!!!). Anyhow, I had soldered all 16 pins of the RAM connector to a RAM chip, which turned out to be impossible to remove (JRI recommended only soldering the corners, but that is a little questionable - although that is how I have it now). Anyhow, I had to remove A RAM chip to get that connector out (I was in a hurry, so broke the RAM chip, but I bout a new chip for $1.50 and soldered it back in, which is easy). The installation in the 520 was easy.

Anyhow, my point is that the JRI board does not cause permanent damage to the ST if you are OK at soldering (and even if not, someone who is could usually undo any simple damage you do).

It is working well. I can use 2.5 and 1.0 MB configs just by changing the chips (i.e. if I really need the 1MB SIMMS for somenthing else). To upgrade to 4MB, I need only to cut three resistors and plug in the extra 2 simms.

mike

2780. Atari TOS versions

Newsgroup: comp.sys.atari.st
Date: 1993-08-18 16:47:33 UTC
From: mcookson@flute.calpoly.edu
Message-ID: <1993Aug18.164733.147801@zeus.calpoly.edu>
Source record: 202252

Here is the info I got from my TOS info request. It is not perfect, but should be helpful to anyone with an older TOS version or ST who was unsure about what versions are available:

(corrections to mcookson@flute.calpoly.edu)

-mike

TOS on ROM Versions
---

28 Pin chips:

TOS 1.0 - 6 or 2 chip set - standard in all older STs
TOS 1.2 - 6 or 2 chip set - ???
TOS 1.4 - 6 or 2 chip set - Upgrade for 1.0. (Rainbow TOS)
TOS 1.6 - 2 chip set - for STE??

32 pin chips: (These are the newest versions)

TOS 2.06 - 2 chip set - for all STs - req. adaptor for ST/Mega/STe
TOS 3.06 - 2 chip set - for TT
TOS 4.04 - 2 chip set - for FALCON

Notes:

The older STs (ST, Mega, STe?, STacy) have 28 pin sockets. Tos 2.06 is the best version of TOS on ROM for these machines, but requires an adaptor. (I am not sure if the STe has 28 or 32 pin sockets, or if it comes with TOS 1.2 or TOS 1.6 - if anyone knows, let me know)

The newer STs (TT, Falcon) have 32 pin sockets, and use 2 chips.

I have not listed outdated versions (except 1.0).

>price is a breakthrough for something with a DSP and stereo 16-bit 50KHz
>sampling/playback.

I pointed this out in my reply to Roger over in .advocacy (if I posted correctly) that the initial release of the ST ran around $900-$1000 for a 1040ST (and even the initial released of the 16k-expandable-to-48k Atari 800 ran almost that high). Give it time to find an audience, and the price will drop like the rest (I mean, I can get a 1040STe for like $349 these days new).

>However, I have got to agree that the Falcon doesn't look very healthy at
>the moment (The ST sold nearly 200000 in the UK one year) and it would be
>unwise to create a newsgroup for it until more have been sold.

Anyone know how many ST's sold their initial year (I'd be curious to know)...

>I think there is a danger that Atari might go back to it's roots if the
>Jaguar proves a success and drop the Falcon altogether.

They would be foolish to do this. Why? The video game crowd generally does not have the same "loyalty" as the Atari computer crowd. Ex-2600 owners probably have Nintendos, Segas, etc. They may pitch those for "the next big thing" which could be the Jaguar. And when that's obsoleted, the cycle continues...

Look at the ST world - there's an obvious loyalty (for whatever reasons) in the Atari computing realm. A lot of people move on to other systems, but I would imagine that's for a particular need (such as staying compatible with their work PC) than anything else (?).

Anyways, this belongs in .advocacy (hopefully my last post like this over here :-)

2786. Atari SLM 804 Laser, 8 ppm, _cheap_

Newsgroup: comp.sys.atari.st
Date: 1993-08-18 19:39:58 UTC
From: dmeggins@aix1.uottawa.ca
Message-ID: <DMEGGINS.93Aug18193958@aix1.uottawa.ca>
Source record: 202268
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

I have an Atari SLM 804 laser printer for sale. This printer can handle transparencies (unlike a DeskJet, for example), prints up to 8ppm (I managed 6ppm for intricate DTP), and runs on most Atari ST-type computers (except, I hear, on the Falcon).

Recently serviced, and has clean bill of health. Drum is fairly new (about 500 pages, I think).

Asking CAN$300 (US$220) or best reasonable offer.

David Megginson (Ottawa, CANADA)

Roger, this is really funny because locally, I now have more Falcon dealers
near to me than I have had since 1987 just because of the Falcon.

See, the machine is selling well to musicians. They may not have
Internet access, but they are buying them up. In the Washington, D.C. area
we were reduced to 2-3 stores you could walk into (Toad and L&Y Electronics
come to mind... Joppa may still be around, i have no idea) and see ST/Falcon
machines.

Now I can go to several music stores and buy one... and they are in stock.

The performance of the machine is not up to TT specs, but there has not been
a lot of widespread development to take advantage of the DSP. With the advent
of compilers that have libraries and functions to access it (i.e., Lattice
and GNU C) we should see that slowly change...

I don't know what you mean by "big problems" in interlace modes. After all the years of listening to Amiga owners discuss ways to minimize flicker with appropriate color selections, i'm sure it can't be any worse than theirs. (Although i must admit, the Falcons i have seen look more horrible than the Amiga when they flicker because the green desktop is the absolutely wrong color to use... Amiga users tend to prefer a black backdrop or have a picture in the background that reduces the effect of interlacing...)

The price does suck... relative to PC clones. But it is an individual decision as to whether the machine delivers the type of performance that makes it worth the investment.... personally, for MIDI uses, i'd be satisfied with it.

Ok, so is GEMulator able to run stock TOS programs or is it devoted to GEM applications? I think Darek's safest assumption is that well-behaved GEM apps would work on his emulator, but those programs are usually the ons that work on every machine.

The catch here is that when he runs things like non-GEM apps that bang the hardware, and it isn't there, i don't see where he will gain much more compatiblity, and the programs he may be running.. well... they are probably old enough that i'd do better to buy an old 1040ST for $75 (less than half the cost of GEMulator) and hook it up to my old SC1224 i have sitting around here unused, and run the program....

I don't think Darek is traitorous at all.... i do think that he is probably supplying a product for the needs of people who are hesitating to buy a PC because they are tied down to ST/e software.

My own rationale for not being too excited over GEMulator is that it seems very complete on the surface, but the people I think who are most tied to the ST are the people who use it for music, and that is the one thing Darek has not supported yet.... MIDI.

I've used the ST emulator on the Amiga, and it too is pretty nice, but some things are not quite right. So far, none of the ST emulators do as good a job of emulating the ST as Dave Small's Spectre GCR does of emulating a Mac.

Yeah, there was an old server (version 1) that came in a single source file,
and a newer server that's somewhat larger; I don't remember what was added
to the protocol other than that it could also do Tektronix emulation.

> To use unix windows to it's full extent, you need to compile the

The Unix system must support pseudo-ttys and Unix-domain sockets. These are
standard in BSD Unix systems, might be supported in some SVR3 ports, and should
be emulated well enough in SVR4 (though, from my experience, really isn't...).
Just for example, SunOS was BSD-derived up to 3.x, with various SysV stuff
merged in; SunOS 4.x was more SysV, and SunOS 5.x is all SVR4.
>
> Secondly, in addition to the Atari version of Unix Windows terminal
>emulator, there are also versions for the PC (DOS and Windows-based) and
>the MAC. You use the same server for all three...

Yep. In fact, UW was originally written for the Mac, and the Mac client is the most complete. I don't think the Atari client has been updated in a long time, dunno if it supports everything the new server does.

>effect is the same as unix windows. And you can even cut-and-paste
>between the sessions.

Yeah, screen is an excellent program. I use it all the time with ConNect, used to use it all the time from Uniterm. But, I do miss being able to see more than one window at one time, like you can in UW. (That's also why I wrote rmgr. But, I seem to have gotten stuck writing GEM programs these days, so I can't have MGR running all the time any more.) If you're running MiNT, and you're not already heavily tied into GEM applications, you should take a look at MGR - it's a very slick, fast windowing system, and if you use my rmgr program, you can have multiple windows *with full bitmapped graphics capability* over a remote communications line.

How about the breakthrough price for the new dsp AV macs with video in and out,
040 25 -40 mhz. Prices start at $2139 list($1560 for students and that is a
big market for Apple...

Well, ya peaked my interest. I assume it's at atari.archive? That
does bring up a question - what files are necessary, and how does one
use rmgr or some other system to do remote dial-ins to. It would be an
interesting excersize to try to run my system remotely (assuming
a "dial up" over the modem)...

[about 158 lines of stuff about Atari ;)]

Well, I'd like to inform you on the 1200xl, 1400xl, and 1450xld, and 5200. The 5200 @ame out a lot earlier than 1985.. more like 1982 or 1983 (I @ould @he<k my old _Atari_Age_ mags if I had the online time.. maybe later). The 1200xl is the same as the 400/800 ex<ept it's operating system.. it allowed for full 64k RAM out of the 64k a<<essable memory.. not just 48k RAM + 16k ROM like the bigger 800's (I believe some 800s had only 32k.. he<k, some 400s only had 8k?? right?!)

The 1400xl was the same as a 1200xl ex<ept built-in modem (?), spee<h synthesis, and some other things I think (again.. I need to @he<k Atari Age). The 1450xld was the same but with disk drives built in, as well. Neither were really released (LOTS of stuff was never really released, though!)

I guess that's all I know for sure needs fixing.

Good work! Keep it up!

So who wants to explain the following: on the 5200 Galaxian box, the copyright date is 1986 atari. On the same box, it says trak-ball compatible (available in august 1983). So which is in error? I'm sure the trak-ball did come out in 1983, but why is the copyright date 1986? Wasn't galaxian one of the first available cartridges? If it's a newer release/box, WHY didn't they remove the clip about the trak ball in 1983??

Just something I remember seeing which fit into this thread.

Hello,
I am in desparate need of an STE! What kind it is doesn't matter! I just need one! And for as cheap as possible, too! My absolute highest limit is $200. Also, I still have my games for sale, if interested in the titles, leave me email. I am in desperate need of selling them, almost as bad as I need an STE. Thanks you.

Well, another report on the "State of the Atari ST/Falcon", this one comes as a result of my attending, at the Hotel Vancouver, the WordPerfect "Beyond Words", North American tour - a tour of 17 major cities where WordPerfect was showing off their latest wares.

Why, then, make this report a "State of the Atari"? Well, it became obvious to me what is going on in the computer world, while attending this show - and what might/could happen to Atari's market share.

The 1000 people heard/saw product reviews on WordPerfect 6.0 for DOS, WP 5.2 for Windows, WP 5.2 for OS/2, WP 5.1 for UNIX, WP 2.1 for Mac, WP Informs 1.0 for Windows, WP Presentations 2.0 for Windows, and WP Office 4.0 for DOS/Windows/Mac. There was no demonstration of, but there was print material for, WP Works for DOS. Prices ranged from the $179 CAN for LetterPerfect (a "streamlined" version of WP 5.2 for DOS), to about $600 for the other main packages.

These things were all Rolls Royces - and there were many people from the offices in downtown Vancouver tripping over each other to buy. Regardless of what one thinks of WordPerfect as user-(un)friendly software, it IS the standard - it IS what businesses have bought into. The people running the show claim a 51% business market share for WP.

The ST/Falcon cannot hope to compete in this kind of market. Yes, WordPerfect is a third party software producer, and theoretically COULD write versions (of, say 'LetterPerfect') for the ST/Falcon. But considering that downtown businesses are not interested in "power without the price", but in, "power at any price" - what has driven the PC and Mac worlds has left the average, garden variety home user like me in their dust. Atari has stayed 'extreme low-end', and specialty (ie. MIDI and multimedia).

However, there still is a market for the likes of me. I am the average, garden variety user, who would not ever hope to be able to use 5% of what WordPerfect 6.0 for DOS can do - let alone realistically afford the $600 price of a single piece of software - over and above about $2500 to $3500 for a decent hardware setup. Home based DOS users have to rely on software written for their extreme-low-end of the market - in exactly the same way we ST users complain about the way software is written for our market. (The one thing that hit me, was that these $600 each packages ARE designed for the BUSINESS LOW END - I did not stay for the afternoon session, for the so-called POWER USERS, meaning those from offices with over 100 computers networked.)

Atari's market share is the German business low-end, and the potential of the home user everywhere else. For some reason, possibly because the Germans prefer the Motorola chip, the ST/Falcon is competitive for the business low end over there. It is non-existent here.

This hits me as far as my next computer hardware purchase is concerned. Do I buy a clone or a PC? Well, maybe. I couldn't hope to afford WordPerfect 6.0 for DOS, much less WP 5.2 for Windows. The existing ST/Falcon software is the equivolent to any home-based user software for DOS or Windows (that is of comparable price - FLASH is superior to Telix and Telemate, for instance).

Do I buy a Mac? Well, I'm buying a business computer, aren't I? I am still buying way more than I'll ever hope to use.

I guess as long as the ST/Falcon hardware market doesn't fold, and as long as the platform as a whole stays healthy in Germany, I will stay with the ST. For me, the garden variety home-user, the only real alternative is the Amiga. But then again, I already have all this ST stuff lying around.

But the long and the short of it - YES, I would love to have a PC with 14 megs of memory, a gigabyte of HD, and running WP 6.0 for DOS. But for me as a home based user, it is simply not cost effective. I would never be able to afford a $1000 printer (more if I wanted a colour printer) to take advantage of the WP 6.0 capability. I would never run into a home-based application that would ever hope to be able to use 5% of what it was capable, anyways - fancy printer or no fancy printer.

It seems to me that in the computer world, DOS and Windows are simply going well beyond what the average user could ever use. It is a terrible waste of money to buy WP 6.0 for home use. And unless you are going to join the Business Low-End, then you are in the same boat as Amiga or ST - you'll find about the same amount of support out there.

The more realistic alternate is in the Amiga or the ST. Even the Falcon is a 'speciality' machine - probably something more than I will ever need. There seems to be a growing gap at the extreme bottom of the computer world (consider that WordPerfect defines "low-end" as an office with less than 10 computers linked....) If the ST were to fold, then something would have to come along to satisfy all us home based users - the Amiga, at the very least would get all the transfer business if the ST folded (and visa versa).

The point is - who is looking out for the home user? Who is looking out for those of use who are BELOW the extreme low end, as defined by WP?

I'm glad I went. It was not a total waste. I saw some 'industry' standard software. And I now have a WordPerfect: Beyond Words Tour, tote-bag. It was about the only thing in there I could afford. It was free!

In a funny sort of way, I feel more secure about the ST/Falcon, and
the place of Atari in the computer market - if Atari doesn't shoot
itself in the foot, that is.

(... and... I got this reply from Desmond Liu in Vancouver....)

DL> That was one long speech, Stuart. You can get off the soapbox,
DL> now :) Actually, I have both an ST and a 386. My most common use
DL> for computers is telecommunication, so it doesn't really matter
DL> which computer I use.

DL> But I basically treat the ST for what it is--it's sort of a cult
DL> machine. I don't expect it to overtake IBM or Macintoshes. The
DL> Atari community is a small but close-nit group of users. As long
DL> as Atari is still around, I'll still support it.

From: cmedley@wam.umd.edu
Message-ID: <24v1au$cqi@cville-srv.wam.umd.edu>
Source record: 202284

It's not a bad machine.. very nice, but it lacks a few things, like for one thing, it has been promoted about as heavily as the Falcon. :) No mention of it since its release in the Washington Post advertising by ANY mac dealers.

So my guess is, it's not aimed at the consumer market, the market most likely targeted by the Falcon030 and Amiga1200.

So looks like Apple will have to try again to kill them. :)

2809. CIVILIZATION

Newsgroup: comp.sys.atari.st
Date: 1993-08-19 05:36:29 UTC
From: afonseca@terapin.com
Message-ID: <afonseca.08pj@terapin.com>
Source record: 202285

Hi everyone. I recently downloaded the demo of CIVILIZATION for the ST, and have to say that its a great game! They did what they could to provide a really great game for the ST, as far as I can tell from the demo. What is the real game like? Is it worth the price? I am thinking of buying it, but want some opinions first.. Is it Falcon Compatible? I think the makers should be sent a letter to thank them for the conversion and hopefully get more over to the Falcon.

Thanks,

afonseca@terapin.com

>Now if someone could show me a single "box" that would allow me to run my
>favorite Atari, Mac and PC applications with little or no performance or
>compatability concessions, all at a reasonable price, I would be one happy
>camper and I wouldn't care less about WHO made the box. I can dream, right?

What he said, totally. But Hutch didn't mention my main pet peeve with multiple platforms: lack of desk space. I would love to be able to get rid of the two keyboard, two monitors, two CPU's problem and just be able to run my ST stuff on the Intel box, even it it was slower and I couldn't play copy-protected games. The biggest annoyance is the monitor. (I have a Sony 1304 on the Intel box; great monitor, but it won't scan slow enough to work with those multisync adapters for the ST.)

It would also be nice to be able to upgrade all the "systems" at once. E.g., if I could plug in a 66DX2 into my Intel box and my ST and Mac software would magically run faster, that would be nifty. Emulation is finally becoming half reasonable!

2811. ICD Host Default Settings

Newsgroup: comp.sys.atari.st
Date: 1993-08-19 06:19:20 UTC
From: zap@eskimo.com
Message-ID: <CBztGq.2Hs@eskimo.com>
Source record: 202339

I have an ICD host for my Seagate 30 meg drive. I have a 4 meg STE
and I don't know what all the various options mean when I am setting up the
hard drive. I don't mind wasting ram as I seldom use more than 2 megs. My
set-up menu looks like this:

Maximum logical sector size (selectable in 512K increments) In system 512

Number of TOS data buffers (0-99) 10

Number of TOS FAT buffers (0-99) 10

Number of sectors in verify buffer (2-99) 32

Number of blocks in cache (1-99) 15

Number of sectors in cache block (2-99) 8

Number of extra folders allocated (0-9999) 64

The settings I have set in the system are entirely arbitrary as I have no
idea what I am doing. Could someone please help to clarify the importance
of different settings? I already know if I max all the numbers out I can
suck up about 300 megs of ram. Thanks in advance for your help.

2814. Megafile 60's (was: Falcon news from ST Format)

Newsgroup: comp.sys.atari.st
Date: 1993-08-19 08:26:53 UTC
From: wmtwen@rw8.urc.tue.nl
Message-ID: <wmtwen.745746963@rw8.urc.tue.nl>
Source record: 202289

Chris.Richards@f712.n286.z1.fidonet.org (Chris Richards) writes:

>I believe there were a few megafiles that used Adaptec controllers for MFM or
>RLL drives, but for the most part they were SCSI drives with ATari's screwed up
>host adapter on them. You should be able to just bypass the host adapter in
>the Megafile and got with it like that.

Well a check on the drive told me that I have an adaptec 4000/4070 in
my Megafile 60. But now for some serious questions:
I only have one drive, which shows when booting with AHDI 0500 as an ID
0, LUN 0 and identification *UNKNOWN*. What does that mean
Identification unknown? Should there be something like Miniscribe... or
Seagate ... where unknown shows up now? Or should it be Megafile 60 or
something I may think up myself.

And another thing. Should a harddisk driver (AHDI) lock itself into the
hdv_mediach, hdv_rw en hdv_bpb vectors or is that something only
viruses do?

The data (please someone check these numbers...)
machine is 1040STF with TOS 1.4 2.5 meg and AHDI 0500:
vector XBRA address:
hdv_mediach DF16 $0000AEAA
hdv_rw 310D $0000AE96
hdv_bpb DF0B $0000AE84

I do not know if these are true XBRA ID's. Just the numbers that were
found before where the vector pointed.

And what is the difference between the shdriver.sys file and the
shdriver.raw file. And what do I need these for. I got my drive second
hand and completely installed so I have no clue what is what, but I
found something strange:
shdriver.sys and shdriver.raw are equally long and produce the same CRC
(using DC_CRC from double click software, excellent util!) but in the
AHDI directory I found another shdriver.sys that has a different CRC.
Just as long as the other two, but still different.
The shdriver.raw and the shdriver.sys that is used produce a F1EB CRC.
THe other shdriver.sys produces A996. Which is correct. Upon checking
with a file monitor I saw no visible difference. Both had the AHDI 0500
message.

I also have hdx5.04 together with ahdi 0600. Is there any advantage for
me in upgrading toto AHDI 0600 and hdx504? Will hdx504 also work with
AHDI 0500?

How do I find out what my drive parameters are? Like number of heads and cylinders? And how many sec/track I have. I have the suspicion that the drive in the drive is not the one originally in the megafile so I'll need this information.

Thanks in advance.

Erlend.

Regarding multiple terminals to a UNIX box:

With Linux, there's a nifty program called 'term', which provides a sort of SLIP connection between two computers. You can then open as many windows to the other side as you want, upload files and redirect tcp/ip connections.

I have hacked term to provide two functions on the atari running MiNT:
-remote shells
-file upload
Term also has its own compression, so that I can read news faster with term and my 2400bps modem than without term.

If someone knowledgeable would like to try this hack out, mail me. I can only provide source for now (which you need anyway for the other side).

> over.

Course, they're might be those people who still think Atari will put out
a Falcon R.T.S. and then you'll have people asking for c.s.a.f40

Just rename c.s.a.st to c.s.a.68 68 as in Motorola 680x0

>it looks like a real winner this time around. It's going to be demoed at the
>Glendale, California show (18-19 Sep). Definitely worth checking out.

Well I am sorry but I have to make some comments on the overly
commercial material presented here.

>Gemulator 3.0 will be released on September 18th 1993, at the Glendale
>Atari Show in Glendale California. The price remains at $229 U.S. complete

A Falconspeed costs not much more so that would make something to
compare a PC with Gemulator with.

>Gemulator 3.0 also adds these enhancements not found on your standard ST:

> - 640x480 color graphics (with any VGA card)
> - 800x600 color graphics (Video7, ATI, Tseng, or VESA SuperVGA card)

Hey with a card any ST can do better than its standard Graphics.

> - maximum ST memory is 8 megabytes, double the limit of an ST

ST's can now be expanded to 12 meg.

> - 1.44 meg high density floppy disks are supported

Yes TOS 2.06 does that. Also for ST's (will need 16 Mhz clock for
controller)

> - support for multiple TOS ROMs

There are also TOS switcher cards for ST's.

To sum it up:
Gemulator is an impressive product if you have a high end PC, but it
does not offer things an ST cannot be made to do.

Erlend.

How can a computer that has only been out a few months be dead?

If it had been out a year and sold a few thousand units then I'd agree with you.
In the UK, the Falcon has sold about 7000 units and is still selling strongly with
many back-orders. Certainly much more than your guestimate. There probably are more
TTs out there but then the TT has been on sale for four years so I would expect it to
have sold more. Remember, in Germany, a hell of a lot were sold and even in the UK
there are a fair few. I can name names for 4 or 5 people with TTs and if thats within
my group of aquantancies, I think even you could extrapolate that up.

|> Just live with the facts that the FALCON is Dead, it has a -100% performance
|> rating, has far to many Bugs, no True colour in High res modes, has Big
|> problems in Interlace modes, screen comes up scrambled very little software
|> support, and I could go on and on...gee and the Price, what a rip off..!!

I grant you the true-colour bit is a drag but to be honest, 256 colour does just
fine for me when viewing and editing GIFs. I have seen no problem with interlace but
then I normally use FalconScreen (PD) and run at 800x600x16 with a fine
non-interlaced picture. SCreen scrambled? Nope. Software Support? Well, apart from
Nethack, TruePaint, Lattice 5.6, Transantarctica, Ishar (VGA graphics/falcon sound
games), masses of PD, PC emulators than run Windows3 in colour, RAM upgrades,
GENlocks (several), video digitisers (several - inc. Truecolour), BlowUp030,
screenblaster, 32Mhz accelerator, kit to add 2 IDE drives INSIDE, Virtual memory,
Kodak PhotoCD reader, NVDI for Falcon, Repro CD, VideoMaster, Cubase Audio,Notator
Logic and probably a few more bits, yeah, right, no support especially for a new
machine. I don't know if you had an ST when they came out but it was the same then.
It takes time to write good software and the beta Falcons have only been there about
a year so give it a little longer before you decide there is no support.

There is quibble about the price though! Far too much. In the UK, a Mac with colour
monitor is GBP300 cheaper ie 650GBP v 950+300(monitor)GBP

Well, HiSoft's Lattice C (5.52) is the best I've used. I used to use
it with 2 Megs and a DS floppy drive. GNU C is also meant to be good
(I'm about to get my hands on it). I think you should certainly try
GCC before buying anything, and if not go for Lattice.

>Long live Atari!!!! ----- Mike Winters winters@access.digex.com
Yeah, I agree - but that doesn't make it more likely.

Well with some machines it was a doddle with others a real pain. When I came to bring mine up to 1meg we found that the holes were all soldered up and had be degunged before we could put the upgrade in. A friend of mine's machine had space for 4 extra memory chips so the sixteen chip expansions were out. Some machines were even socketed!

Using an upgrade board to take the machine to 2.5meg was quite easy on my machine as the appropriate chips were all socketed other machines were surface mounted. It seems that atari used a lot of different production sites all with differing ways of doing the job. Atari couldn't even tell me what the rating of the main power resister was when it blew. "Gosh all those serial numbers and revision numbers mean nothing to use".

You never can tell until you get the lid off. However most upgrade suppliers can stuff the board in for you for a price.

Source record: 202304

Magnavox 8cm-515 color monitor w/ custom cable for Atari ST.

Better than Atari; 14" (vs. 13), better made, useable with

IBM-comp's, Amiga, and composite-video machines (Atari 8-bit,

C=64, vcr, ld player) as well.

* Includes $40 custom 8' cable for Atari ST; separate sound

jack for running sound thru stereo.

* FANTASTIC picture when used w/vcr or ld as hi-res tv; better

than any tv-set! Ideal for one needing both monitor and tv

in a small space. Can even have BOTH on and switch between!

Excellent condition.

$250 + shipping.

2829. Betatesters needed for Neural Net simulation

Newsgroup: comp.sys.atari.st
Date: 1993-08-19 13:51:19 UTC
From: wmtwen@rw8.urc.tue.nl
Message-ID: <2500go$30h@rw8.urc.tue.nl>
Source record: 202298

Hi,

I have spent some time writing a neural net simulator with GEM interface
for Scott Fahlmans quickprop algorithm. Although I still know a few
things that should be added, the program is pretty complete now. I will
need beta testers that will try the program with various configurations
of equipment and make suggestions about improvements. I am especially
looking for people that are familiar with neural nets since the program
does not come with extensive documentation yet.

Current features are:
will work with little memory (I guess 520st's too.)
movable dialogs
network description language
lots of control over algorithm parameters
mouse controlled

Mail me and I will send a betatesters package beginning next week.

>
>Well I am sorry but I have to make some comments on the overly
>commercial material presented here.

If you're referring to Hutch's posting that you quoted, I think you're being unfair. The common rule of thumb is that you're allowed to post such details as long as you're not affiliated with the product in any way. Hutch's post is no more inappropriate, IMHO, than other people's posts about the price and specs of the Falcon.

>A Falconspeed costs not much more so that would make something to
>compare a PC with Gemulator with.

You're missing the point. If you already have a PC clone, which is pretty likely statistically speaking, then you don't need to buy an ST, TT, or Falcon; you just put the board in your PC and use the hard drives, monitor, keyboard, etc. that you've already paid for. No, the Gemulator is not a complete replacement for an ST or Falcon, but it will run GEM things and well-behaved "portable" programs like the GNU stuff.

Another aspect of this is reliability. My ST is flaky as all hell. I have to turn it off and on 4 or 5 times to get it to boot. Sometimes it requires an "ST twist" or two as well. I can't have the case on because it overheats and crashes spectacularly in the middle of an important build (always). It's always been this way, and the Intel box never has; I have an 1986 ST, and perhaps that's why it's so finnicky. The Gemulator would make these problems go away. (Yes, while introducing some others.)

I'm not going to assert that well-made clones are less flaky than current Atari systems, because I don't own a current Atari system. Some things, however, are much easier to claim: the keyboards and mice for the Atari line are really pathetic. You can get detachable keyboards and mice of all varieties (cordless, "Jetsons"-ergonomics, etc.) for PC clones; Gemulator would make these work with the vritual ST. So perhaps ergonomics is more defensible here than reliability.

>> - 640x480 color graphics (with any VGA card)
>> - 800x600 color graphics (Video7, ATI, Tseng, or VESA SuperVGA card)
>
>Hey with a card any ST can do better than its standard Graphics.

But at what price? You've already thrown a Falconspeed onto the pile; now we have to get a Crazy Dots or something? I suspect that a lot of people who still like their Atari's nevertheless don't want to sink any more money into Atari products. I still use and develop for my ST, but there's no way I'm adding a new hard drive, video board, etc. Given the current state of Atari, I personally think it would be an insane waste of money realtive to upgrading a PC or Mac. For people like me, something like the Gemulator makes good sense.

>Gemulator is an impressive product if you have a high end PC, but it
>does not offer things an ST cannot be made to do.

Absolutely correct, but the high end PC system will probably cost you less (in the US, at least) than the enhanced ST-based system you described. This is what's always a bitch about "3rd party" hardware -- the clones always undercut them by huge margins because they're so simple to make. Even Apple's hurting because of this now.

I was refering more to the posts here of late that seemed to brand _Atarians_
as "traiterous" if they used a Gemulator, not Darek.
>
>... the people I think who are most tied to the ST are the people who use it
>for music, and that is the one thing Darek has not supported yet.... MIDI.

Obviously. If you are into MIDI (or Atari games, for that matter) then the
Gemulator is not the best choice (in it's current configuration, anyway).
But if you need to run other ST applications and for some reason do not have
access to an Atari, the Gemulator does now offer a viable alternative, IMHO.

>I've used the ST emulator on the Amiga, and it too is pretty nice, but some
>things are not quite right. So far, none of the ST emulators do as good a
>job of emulating the ST as Dave Small's Spectre GCR does of emulating a
>Mac.

With _any_ emulator, there are bound to be some tradeoffs and they are seldom
as good as the "real thing" in every respect; they may be superior in some
aspects (eg, speed) and inferior in others (eg, compatibility). They do NOT
supplant the need for the "real thing" but rather offer us all more choices.

The GCR is a great product but perhaps of questionable value nowadays since it
costs more than the computer it emulates (used Mac Plus's can be had for $200).
Point is, it _still_ might be worthwhile to the individual who simply does
NOT want another box on his desk. "You pays yer money, you takes yer choice."

Freedom of choice. That's what it's all about, gang.

Even without MIDI support the GEMulator is still useful for music. My
wife has been using an ATARI 1040ST for sequencing and transcribing for
several years now. Unfortunately, transcription often uses more disk
space and memory than the ATARI has. My wife still uses the ATARI for
sequencing, but it was much more cost efficient to purchase a GEMulator
and perform all transciption on the PC. I already had a 486DX-33 so for
a nominal investment in the GEMulator, I can continue to use my ATARI
software without having to invest more money into a computer that has
a shakey future at best (no flames please!).

In case anyone cares, I have been using the version 2.1 of the GEMulator
and found the emulation to be exceptional, even software that talks to
the hardware often works flawlessly. Even games usually work as long
as they are not copy protected (and even some of them will work) and
they only require a mouse (no joystick emulation yet). As far as 8-bit
support I can't say anything at this time; until 3.0 came out, the
emulator would not run. However, I have used the 8-bit emulator on the
ST and it works great with the exception of player missile graphics.

That is one of the nice things about machine code interpreters - it is
possible to intercept writes to hardware. It is possible to make a Gemulator
that is more compatable than any ST.

>probably old enough that i'd do better to buy an old 1040ST for $75 (less than
>half the cost of GEMulator) and hook it up to my old SC1224 i have sitting
>around here unused, and run the program....

I think idea is that you can save desk space if you use a PC anyway, and
you can use all the PC's facilities (Large hard disk drive, XGA display, fast
processor).

We have already reached the stage where the Gemulator can be faster than a
standard ST, and it won't be long before it is as fast as a TT.

I haven't tried version 3.0 out yet, but I did attempt to run PC-DITTO
on version 2.1. I didn't work, all it did was freeze in its tracks.
I was so bummed that I couldn't emulate a 1/4 speed XT with my 486-33,
my (inapropiately named) turbo button can only change my speed to a 25.

2836. ATARI PRESS CONFERENCE

Newsgroup: comp.sys.atari.st
Date: 1993-08-19 15:23:52 UTC
From: L676791@LMSC5.IS.LMSC.LOCKHEED.COM
Message-ID: <93231.30232.L676791@LMSC5.IS.LMSC.LOCKHEED.COM>
Source record: 202305

Atari Corp. held a press conference in the San Francisco Bay Area yesterday (Aug. 18), and today has received major press coverage in the business sections of both the San Jose Mercury News and the San Francisco Chronicle. The press conference was to unveil the Jaguar, and both articles pretty much portrayed it as a last ditch effort by Atari to survive. The San Jose Mercury called it "one last David-vs.-Goliath bid to regain a profitable piece of the huge market it created." The San Francisco Chronice said the Atari "introduced a snazzy new video game machine that beleaguered executives hope will reverse the company's sagging fortunes." Both articles point out Atari's battle for market share with 3DO of San Mateo, California "a high profile, well financed startup company." Many people quoted badmouth the Tramiels. Over all, the articles seem to be pretty good coverage for Atari, although they both make it clear that the Jaguar is the last chance, and that competition is fierce. The Atari Computer division is barely mentioned, and does not seem to be much of a factor in Atari's survival plans.

2839. ST520 & GCR Help Needed

Newsgroup: comp.sys.atari.st
Date: 1993-08-19 16:01:49 UTC
From: gauger@esvx17.es.dupont.com
Message-ID: <1993Aug19.160149.29569@es.dupont.com>
Source record: 202312

AUGUST 18, 1993
I've been setting up an ATARI ST520 to run SPECTRE GCR, but have had
some problems. I need help. Please send replies to my E-mail address, below.

My hardware: ATARI ST520 with 2.5 meg "Z-RAM" upgrade
SUPRA 45 meg HD
ATARI DD DS floppy drive
SPECTRE GCR

Problem 1. I got the HD partitioned, and software loaded and
configured to auto run SPECTRE; on the MAC desktop, it repeated a variation of
the message "THIS IS NOT A MACINTOSH DISK: EJECT OR INITIALIZE" for the
mounted hard disk partition from which the system folder is running! After 5
cycles of "EJECTING" the first partition it would start looking at the floppy
drive, and mount the second HD partition (2 of 2). After this, I'm fine, and
the MAC emulation went well. This was not the smooth start up I expected.
Any suggestions?

problem 2. Last night my four year old son was trying out a shareware
bowling game with good success, when he experimented with other keystroke
combinations to play the game. When I found it, the screen gave a portion of
a SPECTRE error message to the effect 'could not process key sequence : try
keypad . to do 'xxxx' or ALT-INSERT to try 'yyyy'. I powered down the
entire system and tried re-booting automatically, then manually, etc. I
worked backwards till I had unplugged the HD and SPECTRE GCR, and was trying
to boot from the floppy drive. The result was a black screen (occasionally
the screen would go white with fine parallel lines horizontally, and approx 20
degs from horizontal, but this was rare).

I appreciate any helpful suggestions anyone can make. Thanks for your
time. Regards,
Donald Gauger

But this always will occur at the cost of speed. Personally, I'd like to
see one in person, but there are some things I'd like to see, like how it
deals with running ST applications under Windows. I've seen some impressive
screen shots of Calamus running in an ST window under Windows. But I'm
also wondering how fast it goes. I find life pretty painfully slow
using a 16mhz Mega at times, and I believe a 486-33 delivered (roughly)
the performance of one of these machines. Does anyone have the specs on
what type of PC would be comparable (with emulation) would be comparable
to what type of ST?

>We have already reached the stage where the Gemulator can be faster than a
>standard ST, and it won't be long before it is as fast as a TT.
>
>- Leo

Well, if you have a Pentium machine... :)

Actually, one thing I'm wondering about is why Darek has not made an
attempt to also get GEMulator to become a Mac emulator for the PC. The
ST's hardware should be much more difficult to emulate, and he could
probably create something comparable to Spectre GCR based on the
board he has now for GEMulator. It'd be nice if for $600 a user could
have a GEMulator and a MACulator up and running.

>Well, I heard something about Jaguar specs susposed to have been
>released today.. Anyone got any??

Yes, I got a hold of some, but its raw hardware specs, no benchmarks at all.
(or exmaples etc)

13 Mhz 68000 controller
Tom & Jerry RISC's (one is audio, the other is video) "27 MIPS each"
2 megs ram.
sam res as a overscan Falcon (768x576), 24 bit color, 8 bit alpha channel
(32 bits per pixel)

TV, RGB, and SVHS outputs
Comlynx connector, (yes, its compatible with the lynx)

Thats just a quick sampler, i'm trying to dig a little deeper.

Look for more info in AEO as we get it. I'll be posting
in rec.games.video.misc rather than here.

I think a c.s.a.falcon would be a good idea as there are a lot of F'030 issues that wont affect ST users and really are just noise to non F'030 users.

I would also like to see a c.s.a.os group to discuss tos, mint, minix, geneva etc.

just an idea:)

>finally becoming half reasonable!
>

Not to mention that since with the Mac and the advent of Windows, well behaved programs spend large time of their execution performing OS calls. With emulation, the OS calls can be done natively, making up for the speed loss of the emulation of the non-native code. That's why a PowerPC mac is supposed to run 68000 code at 040 speeds.

This is evident in the Soft PC emulator (by Insignia ??), WABI from Sun, and Executor from ANDI. (It's not done by Gemulator as far as I know though...else why would you need the TOS ROM?)

Soft PC is claiming 80% of the CPU speed to run Windows under NEXTSTEP Intel and fast 386 speeds on an 040 (they claim they could do faster on an 040 with a very large cache). With cheap fast chips on the horizon from MIPS, HP, Motorola, and Sun, I hope that Mac/Windows/DOS can be emulated at 040/486 speeds on a wider variety of platforms.

Gemulator (as it stands) doesn't seem ready to take advantage of those gains. Is it platform independent (ie will it run under more than Windows/DOS...like SCO Unix/NEXTSTEP/OS/2)? All of the above (except WABI..and I think they are porting it) runs under multiple OSes. Does it remap system calls to gain more of the "native" performance? I don't know how much Gemulator does of this. I mean, GEM could be emulated to give a speed boost to all GEM programs.

Of course, Gemulator is a "new" product...maybe some of the above is forthcoming, though they aren't simple add ons. You have to be extremely carefull when you "go native" or else you can end up being sued. (We all know now well Derek and Atari get along!)

I wonder if Gemulator runs under MIPS/Alpha NT? Or under NT at all? On an SNP x86 machine. Then we'd see some REAL performance :).

While I have't actually TESTED it. Works does Export/Import RTF. I looked
at the files...it looked like valid RTF to me. I have examined WinWord,
MacWord, and NeXT RTF files before, that's why I looked.

If you really want to know, I guess I can port a few files back and forth.
I was a little interested in how the /fnil fonts (Bitstream) translated
to the Mac and NeXT. I usually transfer files in /fswiss Helvetica and
/froman Times which both systems have. I don't know what'd happen to
/fnil Charter...probably be changed to some default font.

There are a lot of shareware/unprotected games that run just fine.
Unfortunately, without joystick support all you can do is see the
demos/opening sequences of many games.

Actually it should not be difficult to use an IBM style joystick at all.
The IBM joystick is nothing more than a couple of pots that return a
range of numbers (0-255 I believe). All that would have to be done is
to program the GEMulator to set the ATARI joystick registers based on a
preset range of numbers returned from the PC joystick. Essentially setting
the joystick to return an on or off value. PC joysticks are actually much
more responsive than the ATARI style because they don't simply return an on
or off value, but rather a value indicating how far the stick is pushed or
pulled.

>will run GEM things and well-behaved "portable" programs like the GNU
>stuff.

Why would you want to run the ST versions of the GNU stuff when you could
run the FASTER, native x86 versions? Why would you want to blow $300
to run ST software if your one of the "statistically speaking" crowd and
not a former ST owner. Ah...Calumus is good...but is it really THAT
good? And if you want Calumus...buy a TT, you obviously need a professional
platform and can afford it.

Just name a piece of software that a normal x86er would want to run so
badly that they'd buy a $300 board AND the software to do it. I do think
we ARE only talking about ST owners. (Falcon and TT owners wouldn't
take the perfomance hit.) They ALREADY have ST hardware. Hardware they
could upgrade. A 1M Falcon isn't that much more than a GEMULATOR and
is lots cheaper than a 486. Now SOME ST owners have 486's for some
reason or another....I bet there are lots of them. Some of them might
want a Gemulator....THAT is the market.

>Another aspect of this is reliability. My ST is flaky as all hell. I

>never has; I have an 1986 ST, and perhaps that's why it's so finnicky.
>The Gemulator would make these problems go away. (Yes, while
>introducing some others.)

You can usually solve that problem by buying a used 1040 STE which can be had for under $300. A new one isn't much more. Heck you can probably get a 4M STE or maybe even a MEGA. AND keep your ST equipment. Won't make your compiles go faster though. Why don't you just set up GNU to do a cross compile and run the DOS/Windows/Linux version of gcc?

>Some things, however, are much easier to claim: the keyboards and mice
>for the Atari line are really pathetic. You can get detachable
>keyboards and mice of all varieties (cordless, "Jetsons"-ergonomics,
>etc.) for PC clones; Gemulator would make these work with the vritual
>ST. So perhaps ergonomics is more defensible here than reliability.

This is true. But you can expand an ST to have an external keyboard as well. I don't know how well it works...but you can do it. It's only $80 or so (and the price of the keyboard).

>But at what price? You've already thrown a Falconspeed onto the pile;
>now we have to get a Crazy Dots or something? I suspect that a lot of
>people who still like their Atari's nevertheless don't want to sink any
>more money into Atari products. I still use and develop for my ST, but

>the current state of Atari, I personally think it would be an insane
>waste of money realtive to upgrading a PC or Mac. For people like me,
>something like the Gemulator makes good sense.

Hm. You ALREADY have a 486 as well. If I had to buy one, or had decided to buy one. I might be more agreeable to GEMULATOR as well. But, if I bought a 486, I'd run NeXTSTEP. Does GEMULATOR run under NEXTSTEP? Under Linux? Under OS/2? Windows is not worth upgrading to!

>Absolutely correct, but the high end PC system will probably cost you
>less (in the US, at least) than the enhanced ST-based system you
>described. This is what's always a bitch about "3rd party" hardware --
>the clones always undercut them by huge margins because they're so
>simple to make. Even Apple's hurting because of this now.
>

For a "low end" 486 you are going to pay at least 1500. You can get a 4M Falcon in that range. Or a used TT. TT's have nice keyboards too. Maybe they aren't ergonomic...but hey I like them better than typical cheap DOS keyboards. I won't argue that ST third party hardware is expensive realive to the DOS world. It is nice to have the alternative of Gemulator....but I still don't see it as an "upgrade" path for ST's. Someone who really wants a better ST will buy one. Someone who wants to go "DOS" will buy a 486 and MIGHT buy a Gemulator. Personally I'd either keep the ST and software and use the money I'd buy a Gemultor to buy

programs for the x86 (NEXTSTEP INTEL edu price comes to mind), or I'd sell the ST and buy MORE programs. Only if I were moderately well off, would I bother to buy a Gemulator.

2857. UPLOAD: TOSWIN 1.4 + extensions

Newsgroup: comp.sys.atari.st
Date: 1993-08-19 23:57:27 UTC
From: warwick@cs.uq.oz.au
Message-ID: <15001@uqcspe.cs.uq.oz.au>
Source record: 202330

Uploaded to atari.archive.umich.edu:

Sources and binaries (tw14+w10s.zoo, tw14+w10b.zoo) to my extended version
of TOSWIN 1.4. Also has two bug-fixes.

Here's the wwa_ext.doc file:

TOSWIN WWA Extension
---
by Warwick Allison (warwick@cs.uq.oz.au)
(TOSWIN v1.4, extensions v1.0)

Summary:

1. GEM RUN = Run 1 GEM program from within TOSWIN.
2. X SELECT = X Window System Xterm-style cut & paste.
3. AUTO RAISE = Windows are TOPPED when point-to-type.
4. INITIAL REDRAW = Screen redraw done at start-up.

---

1. GEM RUN

The RUNTOS and TOSWIN programs are modified so that 1 GEM program
may be invoked from within TOSWIN when running as an application.

This is only useful to users running MiNT from the desktop with
TOSWIN as the INIT program.

To invoke a GEM program from within a TOSWIN window, use:

runtos -g someprog.prg arg1 arg2 arg3 ...

To invoke a TOS program in a window from within a TOSWIN window, use:

runtos someprog.tos arg1 arg2 arg3 ...

...as before.

This is often useful, for example if you are developing a GEM program
and want to run it, or if you use a GEM program for displaying or
manipulating the TOS files you are developing (eg. DVI_WIND for
viewing LaTeX DVI output, running a RSC editor).

2. X SELECT

The XTerm cut & paste technique is very quick to use:

- Click and drag to highlight a region (as normal TOSWIN).
- Double-click to select a whole "word" of text.

- Triple-click to select a whole line of text.
- Right-click to paste last selected text.

Currently, a "word" is hard-wired to mean:

Any sequence of alphanumeric characters or the
characters "/", ".", "_", or "@".

or Any sequence of whitespace.

or Any sequence of all the same character.

So for example, "warwick@cs.uq.oz.au" could be highlighted with
a double-click, as could " ", "========", "/mint/lib".

To change the hard-wired definition of "word", edit the
CharClass function in "util.c" of the source code.

3. AUTO RAISE

Windows are automatically raised to the top when the mouse
enters them (provided Point to Type is also enabled).

This is another feature that can often be configured on the
X Window System.

Personally, I find it a pain in the neck under X, however, it
is very useful in TOSWIN because under GEM, you cannot drag
or double-click on a window (ie. do all that cut&paste stuff)
unless it is the TOP window.

4. INITIAL REDRAW

When running TOSWIN from the desktop, the MiNT copyright message
and eXtended File System messages mess up the screen. This
extension merely does a screen redraw when TOSWIN initializes.

2858. UNITERM BASIC QUESTION

Newsgroup: comp.sys.atari.st
Date: 1993-08-20 00:20:24 UTC
From: hicksm@hindmost.lpl.arizona.edu
Message-ID: <2515c8$ojd@organpipe.uug.arizona.edu>
Source record: 202331

Hi Folks, just became a new owner of a used atari setup and it seems
to be very nice. I bought it to be the brains of a midi setup and
to connect with school mainframes.

One of the most useful programs I expect to be UniTerm. I spent
a bit of time looking at the README files but I can't figure out
how to do the most simplist of tasks: using the modem to dial out.

So how do I get the program to send a "atdt,xxx-yyy" comand to the
modem?

Thanks for the help
-Michael

>Why would you want to run the ST versions of the GNU stuff when you could
>run the FASTER, native x86 versions?

Well, the x86 versions aren't really quite the same. It's a lot easier to port Unix stuff to the ST than it is to port it to DOS, despite the existence of DJGPP. If you run Linux on your Intel box, then you have a point, but many people still want to run in a DOS environment so they can run standard DOS programs.

The Atari is really great for GNU stuff, thanks to Bammi et al. The PC world still doesn't have quite that level of support, possibly because there are more strong commercial alternatives.

>Why would you want to blow $300 to run ST software if your one of the
>"statistically speaking" crowd and not a former ST owner.

Well, I was assuming there was something to recommend the ST such that people might want to run stuff that's written for it. If that's not true anymore, then it's a pretty sad state of affairs for Atari. :)
The point is that the argument also applies to current ST owners who want to upgrade. Yes, I could spend a thousand dollars for a Falcon. But there's no way I'm going to do that. (See below.)

>Just name a piece of software that a normal x86er would want to run so
>badly that they'd buy a $300 board AND the software to do it.

Well, HacMan II, of course. :) :) ;)

>Now SOME ST owners have 486's for some reason or another....I bet there
>are lots of them. Some of them might want a Gemulator....THAT is the
>market.

Well, no argument there.

Fortunately, it's not my problem if the thing doesn't sell well. :)
But it's a neat hack, and I can see a market for it.

>You can usually solve that [reliability] problem by buying a used 1040
>STE which can be had for under $300. A new one isn't much more. Heck
>you can probably get a 4M STE or maybe even a MEGA. AND keep your ST
>equipment. Won't make your compiles go faster though.

But then I have another doorstop that I can't upgrade. And I don't get the better resolution, don't get to use it with my nice VGA monitor, don't get to have the nice keyboard, etc. There are lots of reasons, and it depends on your personal preference. I really *like* the

ergonomics of my clone, and I really *despise* the ergonomics of the ST, despite having used it heavily for years. Personal taste.

>Why don't you just set up GNU to do a cross compile and run the >DOS/Windows/Linux version of gcc?

Have you actually tried to do this? It's a huge pain, and you still need native ST libraries. If someone has already done it, I'd love to download it and install it on my PC right now. That would be awesome. (But you do still have to carry the binaries over to the ST to test them, which is sort of a pain.)

>Hm. You ALREADY have a 486 as well. If I had to buy one, or had >decided to buy one. I might be more agreeable to GEMULATOR as well.

Well, you can get complete 486 systems (SX) for less than $1000 now. Yes, it's a lot of money nonetheless. But you're going to be spending a lot to upgrade your ST's HD to 300M, monitor to SVGA, RAM to 4M, video to SVGA, etc. if you haven't already done so. The "upgrades" to a packaged Intel system will be less than adding the equivalent stuff to an existing ST system because the clone makers buy in huge volume.

>But, if I bought a 486, I'd run NeXTSTEP. Does GEMULATOR run under >NEXTSTEP? Under Linux? Under OS/2? Windows is not worth upgrading to!

It doesn't really matter, since you can have all those OS's running on a single Intel box with no trouble. At the worst, you could have a minimal DOS paritition for just your ST stuff and use the other OS's the rest of the time. Linux can mount PC paritions, so you could still get at the files. Don't know about OS/2.

>For a "low end" 486 you are going to pay at least 1500.

I'm not going to get sucked into this again, but look in Computer Shopper and you'll find that you're off by about 500 bucks. Nuff' said; I'm still weary from the last battle over prices. :)

>It is nice to have the alternative of Gemulator....but I still don't >see it as an "upgrade" path for ST's. Someone who really wants a >better ST will buy one.

Maybe I'm just a weenie (no comments from the peanut gallery!), but I really don't want to buy another expensive-to-upgrade Atari machine. I mean, I bought a 486 motherboard for $185 for my clone. I couldn't get a fast Atari-compatible motherboard for anywhere near that little. There's less competition, less standardization, less technical wizardry (quantity-wise) in the Atari market, just because the Atari market is so small. These less's make things cost more.

Atari's Falcon is nifty, as I'm sure their forthcoming machines will be, but you pay a price for owning "3rd party" hardware: fewer, more expensive upgrades, slower machine evolution, less software available, and funny looks from the 98% of computer users that have never heard of your machine.

2860. Atari Jaguar - FIRSTHAND REPORT

Newsgroup: comp.sys.atari.st
Date: 1993-08-20 01:02:20 UTC
From: rjung@netcom.com
Message-ID: <rjungCC19Jx.J20@netcom.com>
Source record: 202335
Cross-posted to: rec.games.video.misc,alt.games.lynx,comp.sys.atari.st

Okay, folks. At last, we've got a first-hand account of a live sighting of the Atari Jaguar! Coming fresh from the machine's official rollout on August 18th, the following is an electronic chat between Chris Millar of Delphi and Andy Eddy, well-known video-gaming journalist and net.lurker. B-)

I've cleaned up the stuff to make it a little more presentable, but I have not altered anything vital. Andy and Chris' exchange is below; comments in [square braces] are from yours truly.

''''''

[50 megabytes?!?]

* 16 megabits [2 megabytes] of fast page-mode DRAM.

* An optional double speed CD-ROM drive. ($200, sometime during 1994)

* ComLynx I/O for networked multiconsole games (even with Lynx and Jaguar mixture).

[I smell a Lynx adaptor for the Jaguar in here. And the idea of chaining Jaguars and Lynxes is tantalizing]

* Two (expandable to literally dozens) enhanced controller ports, supporting digital and analog interfaces, as well as keyboards, light guns and mice.

[Expansion probably by a multiple-port tap, naturally]

* High performance, ergonomically designed, controller with joypad, three fire buttons, Pause, Option, and 12-key keypad with game-specific overlays. ["Ergonomically designed"? Definitely press release hype]

* High speed synchronous serial port for connection to modems, cable TV, networks and other high performance networks.

[No word of the rumored built-in modem. Darn]

There are two custom chips, code-named Tom and Jerry, which combined contain four processors. Jerry has the DSP, the 8K SRAM, a sound block and a block for "timers, UART, joysticks and clock control." Tom has the "DRAM memory controller, object processor, GPU (w/ 4K SRAM) and the blitter." The 68000 is separate as it has the DRAM and cartridge/CD-ROM ties.

No discussion of licensees signed or interested. Formal announcement(s) will take place in mid-September.

<<Chris>>
What games did you see?

<<Andy>>
The games are much like the 3DO stuff that has been shown.

CYBERMORPH is a side-scrolling shoooter, and there was a way to move ahead in the game with a button push (I suspect as a demo), and it screamed the data past the screen F-A-S-T. CYBERMORPH has been renamed to something like "Trevor McFur in Crescent Galaxy" [Uh-huh...]

There was also on-the-fly rendering, much like STARFOX, but without the ship "on rails", in the words of [Atari Technical Spokesperson] John Skrutch. You can go anywhere. [Is this CYBERMORPH, or some other game? CM is a side-scrolling shooter, but "going anywhere" requires a first-person perspective...]

Also, a scene from ALIEN VS. PREDATOR.

I missed all but the last two questions in the presentation, so I'm going to try to get a copy of the videotape they made of the event.

<<Chris>>
Would you say the 3DO stuff you have seen surpasses what you have seen thus far for the Jaguar?

<<Andy>>
I'd say it's comparable. That's an important note, given that the Jaguar is one third the price, or about half if you add the CD-ROM drive.

[Maybe not that low. A $199 Jaguar and a $200 CD-ROM drive totals $400. And now there are rumors that the 3DO unit from Panasonic may sell for $499. But then, you don't _need_ to get a CD-ROM with the Jaguar...]

<<Chris>>
Can you describe the physical Jaguar unit?

<<Andy>>
Sleek, black, kinda like a Merlin: Rounded corners on a square unit. Like someone said, though, when the CD is on top, it looks like a toilet... (especially when the CD cover is popped up). [This implies, of course, that Atari was showing either a CD-ROM prototype of some kind with the Jaguar, or an illustration of the same]

Also, Atari is dropping the "only Ataris" policy for development and such. [YAY!] Because of that, there is an [Atari] TT development station and a PC station, but tools are being used on Macs and others. They are still talking about using high-end computer rendering software that already exists (like SoftImage, which was used on commercials and on Sega's Virtua Racing).

<<Chris>>
Can you desribe the scene from ALIENS VS. PREDATOR you saw?

<<Andy>>
It was just a representation of what the halls would look like while you moved through them. Very cursory. I was going to sign an NDA to see more of the stuff upstairs, but they didn't have one handy (the guy was out to lunch) and I wouldn't be able to talk about them anyway (hehe).

Also, I'm trying to get disk files of pictures, which Bob [Brodie] is working on. Oh, and there will be a detailed conference with Bob and Sam [Tramiel] next Wednesday, in the World of Video Games SIG, right here on Delphi!

They handed out great T-shirts. (hehe)

''''''

things will get very exciting in the next few months.

Ladies and gentlemen of the net...Let the speculation begin.

--R.J.
B-)

P.S. Chris also had something nasty to say about certain people on the net, but civility prompted me to remove it. Though I think someone should fetch a waiter or waitress somewhere -- I believe Mr. Raul "Die Jaguar Die" Romero has a triple-order of crow waiting...

LS> only temporary, but the problem now exists.

BINGO! Give the man a cigar! :-{)

Seriously, whenever you have spooky problems like this with your machine, the first thing you should suspect is your Auto folder, and the second is to suspect loose chips. Since you shook the machine and that seemed to at least temporarily fix your problem, I would STRONGLY suggest opening your machine up and reseating ANYTHING in a socket.

] I think a c.s.a.falcon would be a good idea as there are a lot of F'030 i
] that wont affect ST users and really are just noise to non F'030 users.
]
] I would also like to see a c.s.a.os group to discuss tos, mint, minix, ge
] etc.
```

What damage is making a new group going to do anyone? Those not interested in the Falcon won't have to read about it, and those who are just have to subscribe to 1 more group - if anyone out there is willing to take up thet task of handling votes, then you might as well go for it. comp.sys.atari.falcon and comp.sys.atari.misc (misc being discussion on alternative OS's or non ST/TT/Falcon machines) would probably be the things to go for - if nothing else, just c.s.a.falcon

Take into account the hundreds of groups that get less than 1 post a week, a fair percentage being bogus, so 1 legit' group is hardly going to be too much of a strain! Even if it halves the message flow, that's still in excess of 25 new messages a day, which is more than a lot of the extra amiga and pc groups get!

E: So, Who won?

MC> TOS 4.04 - 2 chip set - for FALCON
MC> The newer STs (TT, Falcon) have 32 pin sockets, and use 2 chips.

TOS for the Falcon does NOT come on two chips, nor are they 32 pin chips.
Instead, TOS for the Falcon comes on ONE 16 bit wide 44 pin quad flat pack that
is socketed.

I haven't had your specific problems, but my ST did start acting very wierdly in the past. I tried everything in the world in the way of reconfiguring my software. Finally, I simply took the machine apart, blew the dust out of the innards, pressed all the cips gently into place, and put it back together. It worked fine. This has happened 3 times in the past 6 months or so.

>
>Iain

Well I should post some of the articles from ST-Report that also state what I
think, here in N.Z. the Book shops have Amiga magazines falling of there
shelves, I have to hunt around for the only 3 UK magazines that we see here,
and they are allmost rubish..

Have a look at the Amiga 1200 HD, Price its nearly 1/2 of the Falcon, to me the
Falcon does not warrant a 100% price hike over the Amiga 1200 HD, I do think the
Amiga has far more to offer and is more compatible with software than the
Falcon is..

I do think that the Amiga 1200 HD has for more to offer for its PRICE..

Here you will not find any Shops at all Selling Ataries even Music Shops
here are pushing the Mac and the PC to do that...

Please if People read in what I post, they must aggree, but then again People
can't read, or they are just lying to them selves...

I enclose this part about Screen Problems taken from ST-Report 933..

- Las Vegas, NV WHY ARE CERTAIN DEVELOPERS UPSET ABOUT FALCON VIDEO?

Amidst claims of defective, missing a vital part and simply general
disgust, a number of long time developers are making their thoughts known
about the Falcon's Video output. Its seems, according to one dev, that all
it will take to fix is the inclusion of an inexpensive part. Yet it is not
being done and the remark that "we are not in the business of fixing things
for third party developers" is the alleged answer from the company. Seems
the overlay bitmask in the interlaced mode is like shooting dice. You have
a 50/50 chance of the screen coming up scrambled! Another dev who also
asked to remain un-named said it all when he said "So where is all this NEW

software they were harping about? The Falcon is not selling well at all."

"""

So please check these things out before you all rant and rave about me here..

Roger.................. sheppard_r@kosmos.wcc.govt.nz

I can't comment on pricing for your area but as far as ST compatability goes, I have found less software fail when I went MSTe->Falcon that when I went TOS1.0->1.4->2.06.

So far I've run Protext, Wordup, Lattice C, Thats Write 2, Autoroute, EasyDraw and a whole host of other stuff with no problems. Basically when I bought the Falcon, I unplugged my hard drive from the MSTe, plugged it into the Falcon and continued as before, just abit faster and with a lot more colour.

The only 2 programs of note that refuse to run are VIP Pro which is a pain and Timeworks 2 DTP. There should be a bug fix of the latter soon as it being beta tested right now.

>At least it offers more functionality for comparable price when
>compared to Tempus Word.

WHAT? I was talking about the word processor Tempus Word, not the text
editor Tempus Editor. Tempus Word has much more to offer than Atari Works.
Some of the best features:

- uses Tempus Word fonts, Speedo fonts, Signum fonts, Calamus fonts
- automatic index creation
- automatic numbering of paragraphs and/or pages
- automatic creation of a text's table of contents
- several layers for automaically numbered text references
- footnotes, endnotes etc.
- footlines, headlines
- supports several columns per page
- sophisticated page layout, may be individual for each page

There would be a lot more to say but for a lot of features I don't know the
Englisch words.

I'm impressed. Here I am actually agreeing with you. I suppose it just comes down to whether you put up with the price increases for the computer system that you prefer.

Having said that, about all you can't upgrade in a Falcon is the motherboard, and upgrading that would be a problem because of all the extras on it that would have to be put there on your upgrade. DSP, codec etc. There are a surprising number of 'standard' (ISA ? :-) interfaces in a Falcon. Things are getting better.

Info-Kermit Digest Mon, 9 Aug 1993 Volume 18 : Number 2

Today's Topics:

New FTP Server for Kermit Files
Announcing C-Kermit 5A(189) for the Commodore Amiga
MS-DOS Kermit 3.13 Updates
MS-DOS Kermit 3.13 USR Sportster Dialing Script
Host Identification of MS-DOS Kermit 3.13
Update to MSIWP3.COM using the APC-Macro
New Packet-Driver Shim for DEC Datalink Specification
New Release of GOLD.COM (Num Lock = Gold Key)

Digest submissions may be sent to Info-Kermit@columbia.edu or
KERMIT@CUVMA.BITNET. Requests for addition to or deletion from the

Info-Kermit subscriber list should be sent to LISTSERV@CUVMA.BITNET or LISTSERV@CUVMA.CC.COLUMBIA.EDU. These messages must be of the form:

SUBSCRIBE I$KERMIT <your-personal-name> (To start a subscription)
UNSUBSCRIBE I$KERMIT (To cancel a subscription)
REGISTER I$KERMIT <your-personal-name> (To correct your name)

Kermit files may be obtained over networks and by mail order. On the Internetwork, use FTP to log in to host KERMIT.COLUMBIA.EDU, a Sun SPARCserver running UNIX (SunOS 4.1), IP host number 128.59.39.2. Login as user anonymous (note, lower case), any password, and GET or MGET (MULTIPLE GET) the desired files. The file kermit/read.me is a general guide to where things are. The Kermit files are in directories kermit/a, kermit/b, kermit/c, kermit/d, and kermit/e. Test versions are in kermit/test. All files in these directories should be transferred in text (ASCII) mode. Binaries are in kermit/bin (use ftp in binary mode). All files (with the exceptions of some of the READ.ME files) have lowercase names, and case is significant.

You can also get Kermit files over the BITNET/EARN network; to get started send a message with text HELP to KERMSRV, the Kermit file server, at host CUVMA. For detailed instructions, read the file kermit/a/aanetw.hlp (AANETW.HLP on KERMSRV). To order by mail, request a complete list of Kermit versions and an order form from Kermit Distribution, Columbia University Academic Information Systems, 612 West 115th Street, New York, NY 10025 USA.

Date: Mon, 9 Aug 93 12:00:00 EDT
From: Christine M Gianone <cmg@columbia.edu>
Subject: New FTP Server for Kermit Files
Keywords: Kermit Files by FTP, FTP Server for Kermit Files

The Columbia University Kermit FTP archive will begin running a new FTP server in a few days. This is the same server used (and developed) at Washington University at St. Louis (wuarchive.wustl.edu), WUSTL FTPD 2.1. It is more user-friendly, and it gives us some additional logging capabilities. This change should not affect sites that automatically retrieve directory listings to be used for obtaining new files. Interactive users, however, will notice a new message when first logging in, and will also receive short messages when cd'ing to different directories. These messages give short pointers to where things are. Thanks to Fuat Baran for installing the new FTP server.

If you access Columbia University via automated ftp procedures, you can check them in advance against the FTP server at wuarchive.wustl.edu and make any needed modifications before we switch over.

Also, for anonymous ftp access to Columbia University, you are encouraged to use the hostname kermit.columbia.edu rather than watsun.cc.columbia.edu, although both are (for the foreseeable future) equivalent.

Date: Mon, 9 Aug 93 12:00:00 EDT
From: Christine M Gianone <cmg@columbia.edu>
Subject: Announcing C-Kermit 5A(189) for the Commodore Amiga
Keywords: C-Kermit 5A, Amiga, Commodore Amiga

From Olaf Seibert in the Netherlands and Stephen Walton at the University of California at Northridge:

. All the new features of C-Kermit 5A(189) (See Info-Kermit V17 #3)
. Now compilable with SAS C 6.x as well as Manx Aztec C
. 8-bit terminal mode enabled
. Automatic screen sizing improved
. Corrected date/time reporting
. Numerous internal improvements

The new files, all of them Amiga-specific, are in kermit/b/cki*.* on kermit.columbia.edu (CKI* * on CUVMA). The binary executable can be ftp'd in binary mode from kermit/bin/ckiker.exe on kermit.columbia.edu.

Date: Mon, 9 Aug 93 12:01:00 EDT
From: Christine M Gianone <cmg@columbia.edu>
Subject: MS-DOS Kermit 3.13 Updates
Keywords: MS-DOS Kermit 3.13, Patches

A new patch file is available for MS-DOS Kermit 3.13, which corrects a number of minor problems (if you have not experienced these problems, then don't worry about the patches). To use the new patch file, you'll also need to get a new MSKERMIT.INI file, which corrects the method for locating the patch file. Or you can edit your MSKERMIT.INI file as follows. The line that says:

if > \v(version) 312 if not inpath MSR\v(version).PCH goto begin

Should be changed to:

if > \v(version) 312 if inpath MSR\v(version).PCH goto patch

And then, a couple lines down, insert a :PATCH label before the ECHO command:

:PATCH
echo Installing patches...

In version 3.12 and earlier, the patch file had to be called MSKERMIT.INI. In version 3.13 and later, it can also be called MSRxxx.INI, where xxx are the digits from the version number, in this case MSR313.INI. MSRxxx.INI takes precedence over MSKERMIT.INI in case you have both files. This lets you run different Kermit versions on the same PC without having to rename your patch file each time.

The patches, from Prof. Joe Doupnik at Utah State University, include:

1. Optional 132-column video mode for Orchid Designer Professional VGA.
2. (a) Make SHOW PROTOCOL display handshake character correctly;
(b) fix \KdgC3 and \KdgC4 verbs.

3. Correct insert/delete-character when at right margin.
4. Correct CONNECT-mode status line to stay off if SET to OFF.
5. Correct invocation of DEC-MCS character set.
6. Correct selective-erase-in-line.
7. Correct two graphics mode errors.
8. Make ENQ response immediate on network connections.

Several other problems with version 3.13 were noted and corrected:

1. As noted above, the patch-file-finding test in MSKERMIT.INI was wrong.
2. KERMIT.PIF file internally referred to MSTIBM.EXE rather than KERMIT.EXE.
3. USR Sportster dialing script (SPORT.SCR) contained an error (see below).

The following corrected files are now available:

Internet anonymous ftp EARN/BITNET
kermit.columbia.edu KERMSRV@CUVMA Description

kermit/bin/msvibm.pif (none) Program Info File for Windows
kermit/a/mskermit.ini MSKERMIT INI Corrected initialization file
kermit/a/msr313.pch MSR313 PCH New patch file, patches 1-8
kermit/a/msvpif.boo MSVPIF BOO BOO-encoded IBM PC Windows PIF file
kermit/a/mskerm.bwr MSKERM BWR Updated "beware" file
kermit/a/msmsport.scr MSMSPORT SCR Corrected Sportster dialing script

An updated ZIP file containing the complete version 3.13 distribution with updated or corrected files listed above is available via anonymous ftp (binary mode) from kermit.columbia.edu as kermit/bin/msvibm.zip. It also includes a new release of the GOLD (Num Lock = Gold Key) program (see below).

Date: Tue, 03 Aug 1993 11:09:59 -0500 (EST)
From: David Kurzman <DAVEK@Vax2.Concordia.CA>
Subject: MS-DOS Kermit 3.13 USR Sportster Dialing Script
Keywords: USR Sportster Modem

I just downloaded kermit 3.13 (for DOS) and I tried to configure the modem for a US Robotics Sportster (14400 baud external FAX modem). I get the following message when I try to auto dial a number:

ATQ0V1
OK
AT E1 W1 X4 &A3 &D2
ERROR

[Ed. - Several people reported this problem. "W1" seems not to be a valid Sportster command. Just remove it. An updated copy of the Sportster dialing script is available in kermit/a/msmsport.scr, and included in the new msvib.zip file.]

Date: Thu, 5 Aug 93 12:06:00 EDT
From: Mike Wright <mcw@pine.circa.ufl.edu>
Subject: Host Identification of MS-DOS Kermit 3.13
Keywords: APC Macro, TERMINALR/S Macros, Answerback, MS-DOS Kermit 3.13 and APC

We distributed many copies of Version 3.12 with the TERMINALR and TERMINALS
macros defined and then defined commands on our VMS and UNIX systems that
called C-Kermit so we could have simple commands like PCGET and PCPUT. But
3.13 removed that feature so I seem to be painted into a corner. If I
change the host to use the new APC feature, then all the old copies of 3.12
that users have don't work anymore. But I can't start distributing 3.13
unless I do change the host. I'm assuming that I can write some elaborate
script in C-Kermit that will test for and work with either 3.12 or 3.13, but
I haven't done that yet. Is there another way around this?

[Ed. - MS-DOS Kermit 3.13 responds to ENQ (Ctrl-E) from the host with the
string "MS-DOS KERMIT" (without the quotes), but only if you SET TERMINAL
ANSWERBACK ON (it is OFF by default). Earlier versions do not support
answerback at all. So you could do something like this (using C-Kermit
5A(189)):

```
apc set term answerback on ; This has no effect on 3.12 or earlier
set input echo off ; Avoid confusing echos
output \5 ; Send ENQ
input 3 MS-DOS KERMIT ; Look for response
if failure goto pre313 ; It's earlier than 3.13
apc set term answ off ; It's 3.13 or later, turn answerback off again
(commands here for 3.13)
...
:PRE313
(commands here for 3.12 and earlier)
...
```

However, there is also a bug in version 3.13 that prevents the answerback
sequence from being sent -- on network connections only, not serial
connections -- until the next character is typed at the keyboard. This is
fixed by patch 8 to MS-DOS Kermit 3.13. So, when you distribute version
3.13, make sure you distribute it with the new MSKERMIT.INI and MSR313.PCH
files mentioned previously, and then you should be able to use the ENQ test
reliably to distinguish between 3.13 and earlier versions.]

From: Robert C Martin Jr <GRAPHICS@ACS.EKU.EDU>
Subject: Update to MSIWP3.COM using the APC-Macro
Keywords: MS-DOS Kermit and VMS WordPerfect, APC Macro

I recoded the below VMS DCL program that automatically redefines the keys
for use with VMS WordPerfect. It now uses the APC-MACRO stuff, which I
think has a bunch of potential. The program is still rather straightforward
DCL, however I added (fixed) a few things since the last time that I
submitted it and kept compatibility with the old version's usage (I hope).

I did NOT attempt to check which version of MS-DOS Kermit that the person is using, though. I hope that this helps the VMS folks!

Robert C. Martin Jr., M.A. -- Computer Consultant

Eastern Kentucky University -- Internet: Graphics@acs.eku.edu
Richmond, KY 40475-3111 Phone: (606) 622-1986 or 1995

[Ed. - Thanks, Bob! The new version replaces the old one as kermit/a/msiwp3.com on kermit.columbia.edu, and MSIWP3 COM on CUVMA. Also, see above for a suggested method by which a host application can tell the difference between MS-DOS 3.13 and earlier versions.]

Date: Tue, 27 Jul 93 11:20:56 PDT
From: Brian Angus <angus@trcu17.enet.dec.com>
Subject: New Packet-Driver Shim for DEC Datalink Specification
Keywords: Packet Drivers, PATHWORKS, MS-DOS Kermit and PATHWORKS

I have written a shim to allow Kermit's TCP/IP to coexist in the DEC PATHWORKS DECnet environment. It provides a packet driver interface over the Digital's Datalink (DLL) specification drivers. It is similar in function to DISPKT9 and ODIPKT, but is potentially more useful for people working in a DEC environment.

If you could post this in the packet-driver directory on WATSUN, it could be quite helpful for a large group of DEC corporate users as well as for many of Digital's customers.

[Ed. - Many thanks, Brian. Your contribution has been placed in the various packet-drivers subdirectories (src, bin, doc, new) on kermit.columbia.edu as pktdll.*.]

Date: Wed, 4 Aug 93 11:36:45 BST
From: Bob Eager <rde@ukc.ac.uk>
Subject: New Release of GOLD.COM (Num Lock = Gold Key)
Keywords: GOLD.COM, Num Lock, MS-DOS Kermit and Num Lock

I am the author of GOLD.COM (a.k.a. MSUGOLD), distributed with MS-DOS Kermit. GOLD.COM is the TSR program that allows the Num Lock key to generate a BIOS scan code readable by Kermit, so it can be mapped to the DEC Gold Key (or any other key). I have had mail from a few people about a couple of problems with it, and have fixed the problems. The new version allows the Num Lock state to be changed even while GOLD is active, by pressing Shift and Num Lock, and also allows GOLD to be turned off and on after it is loaded, by pressing Alt and Num Lock. It also fixes several minor problems, e.g. with the Pause key.

Bob Eager

[Ed. - Thanks, Bob! The new version, 2.4, is in kermit/a/msugold.*:

Internet anonymous ftp EARN/BITNET
kermit.columbia.edu KERMSRV@CUVMA Description

ker  mit/bin/msugold.com (none) Binary executable GOLD program
kermit/a/msugold.boo MSKERMIT INI BOO-encoded executable GOLD program
kermit/a/msugold.doc MSUGOLD DOC Documentation
kermit/a/msugold.asm MSUGOLD ASM Source code
kermit/a/msugold.bat MSUGOLD BAT BATCH file for building from source
kermit/a/msugold.ini MSUGOLD BAT Sample Kermit key mappings

The new GOLD.COM and GOLD.DOC files have also been added to the new
MSVIBM.ZIP file.]

End of Info-Kermit Digest

2887. TRADE: my Mac SE 030 for STE!

Newsgroup: comp.sys.atari.st
Date: 1993-08-20 13:17:04 UTC
From: lancer@rajeesh.WPI.EDU
Message-ID: <LANCER.93Aug20131704@rajeesh.WPI.EDU>
Source record: 202368

I'd like to propose a trade:

I have a Mac SE with 68030 + 68882 FPU, 4 megs of RAM, and 2 800k
drives which I'd like to trade for your Mega or normal Atari STE!

This is your chance to jump ship and leave all us poor Atarians to our
worthless, dead-end technology! Or maybe it's just a chance to get
rid of your old STE... Whatever it is, I like my Atari and don't like
my Mac...

Anyone want to trade?

thanks,
.s.

Hi Michael!

W>What flight simulators do you all like (I got a 1040St with 1 MB
W>memory & built in floppy drive)
thinking ...

...

Gunship!

I run it on a Mega STE in 16MHz and it's fast like hell :-)
But on your computer it doesn't run much slower (i had a 520ST+ and it was
quite fast there too).
Well, the grafx isn't very exciting and the mission are typical
'microprose-boring' but it's fun (for me).

Next one is Star Wars although it's not totally a flight simulator.
But You should take a look at me playing it:
I move as if I'd be sitting inside a X-Wing killing my Trak-Ball.

Bye
Stefan

> I have an ICD host for my Seagate 30 meg drive. I have a 4 meg STE
> and I don't know what all the various options mean when I am setting up the
> hard drive. I don't mind wasting ram as I seldom use more than 2 megs. My
> set-up menu looks like this:

> Maximum logical sector size (selectable in 512K increments) In system 512

This means that you are not using BGM partitions (those that allow bigger
than 32mb by increasing the block size). For a 30mb device, this is
perfectly understandable. Increasing the block size does slightly increase
access time, but you pay for it in terms of drive efficiency. My suggestion
is to stick with regular TOS blocks (512k). If you get a bigger device, you
may wish to reconsider.

> Number of TOS data buffers (0-99) 10

These are internal TOS buffers that exist above the ICD caches. Increasing
this will speed things up slightly, to a point.

> Number of TOS FAT buffers (0-99) 10

Extends the TOS internal FAT buffers, which will speed things up quite a bit.
There are about 4 FAT buffers per megabyte. Thus, having more than 120 on
your device would be useless.

> Number of sectors in verify buffer (2-99) 32

Number of sectors accumulated before a write. Increasing this will increase
write (with verify) speed to a point. Write verify must be turned on for
this to have an effect (which will slow writes about 50%). I leave mine
turned on, as it is comforting.

> Number of blocks in cache (1-99) 15

How big your cache is. Bigger is better, to a point.

> Number of sectors in cache block (2-99) 8

Minimum sectors to be read or written into the cache. Increasing this will
speed up access to a point.

> Number of extra folders allocated (0-9999) 64

Bump this number up. This value delays (note that it does not get rid of)
the TOS folder limit bug. I have mine set to 1000, but I have quite a bit
of disk space. As a guess, I would suggest that you set it to about 200. It
will take up a bit of memory, but this is better than frying a partition!

Every place above where I use the phrase "to a point" I am refering to a diminishing return relationship (i.e. doubling the number might give you 30% faster reads, but doubling again might only give you an additional 55).

You need to get an ICD manual. Also, you probably do not have the latest greatest ICD software (6.2.0). I suggest you call them up and ask how you can obtain a printed manual and a disk with the latest software. Their number is (815)968-2228.

First, connect your modem to your machine and power everything up. Then, run Uniterm. Then, set the baud rate (in Uniterm) to your modem's max baudrate. Then, type "at<return>" and see if it responds with an "ok". If it responds with a "0", you have numeric return codes turned on (in the modem). If it says nothing, you either have echo return codes turned off, or your modem is not working properly (or it is not a Hayes compatible modem). Try typing "at&f" to reset your modem to factory defaults (this may not work on all modems). Every time I have had troubles making a modem work with a terminal program, it was the modem's fault (given that the terminal program was in its default configuration, and all the hardware was ok). It is possible that your Uniterm configuration is weird, due to experimentation. Simply delete the uniterm.set file, and it will revert to the default settings (save a new .set file after you get it working).

If you get the modem to respond with an "ok" or a "0", you should be able to use it to dial out. You can either type in "atdt xxxxxxx", or you can set up an entry in the dialer so you can just click to dial.
By default, Uniterm does not embed a pause (the "," in your dial command above). If you really need it, you can change the dial command in Uniterm (from the dialer menu item, I believe). It is likely that you don't need it though.

If you still cannot get it to work, feel free to email some specific symptoms to me. You might want to check the cable before you do anything, as it is the weakest link.

M>TOS 4.04 - 2 chip set - for FALCON

Are you shure? My FALCON definitely has only *one* ROM. The equal EPROM-type is a 27C4096, for example a HN27C4096CC-10. This one I'm using with my TOS 4.04.

regards, Jimmy

I presume that you mean "verses using a television". It is true that much
of the professional grade software for the ST requires a high res mono monitor
to work (they are very nice, much easier to look at for long periods of time).
Most commercial MIDI software needs a mono monitor, to my understanding.
Using a television with an ST will only allow you to use the low and medium
resolutions defined by GEM. Some such programs will work in color, but are
much more usable in high res (which requires a mono monitor).

I always encourage ST folks to get both a color and a mono monitor. Color
capability is great for games and graphics, mono is great for DTP, modeming,
MIDIing, Mac emulation, etc. You can find a good deal on used monitors in
this very newsgroup. I have purchased two mono monitors for ~$40 each from
posts in this group over the last few years.

> times in the past 6 months or so.

For folks with the loose chips problems, I suggest you apply some Cramolin
to the legs of the chips the next time you take the machine apart. Cramolin
is a magic goop that eats off corrosion on electronic parts, and as a
side effect will cause metal to metal contacts to really want to stay together.
It acts as a sort of "Loctite" for electrical gear. It used to be sold
through Techni-Tool, but I am not sure if they still stock it.

Granted the ST can be upgraded to the same capabilities that the
Gemulator comes with, but you forgot to mention the costs. If you
buy a graphics card for your ST, you will probably need a new monitor.
To boost the memory (on a stock ST) you need to buy special hardware
and memory chips. To use a high density drive you'll need to purchase
a new drive. Don't forget that you'll need a hard drive controller and
drive if you want a hard drive.

In all these cases, a 'stock' PC has all the necessary hardware at a lot
cheaper price. Don't get the wrong idea, I'm not saying that the GEMulator
is or should be a replacement for an original ST. However, in my case, the
GEMulator has allowed me to complement my 1040ST and continue to use some
of the more hard drive intensive software without much more expense.

Well the only other one I can recommend (I think Falcon is the best) would be Battle of Britain by LucasArts. This is a pretty good WW2 flight sim (what no radar, no missles?!). You may also want to look at Gunship (I hear rumors that Gunship 2000 might actually make it to the Atari?). This is an Apache helicopter sim. Of course there are other no so realistic space flight sims but thats a whole other story.

Are you sure it's MiNT that doesn't like the "\" paths? It might
be your shell that doesn't like them. For instance, running under mint,
using Mupfel shell from Gemini lets you use "\" as usual. Now TC Shell,
on the other hand, expects paths to use "/" instead. Might test
a different shell just to see...

Robert Anisko
ranisko@ipc41t.daytonoh.ncr.com
R.ANISKO@genie.geis.com

...talking about paths, I was attempting to use Bison120 from
atari.archive.umich.edu (in the Mint directory somewhere I think).
I was able to get it to find the bison.* files but then it
was trying to write temporary files (I think) to /tmp which Mint
doesn't seem to like - is there an environmental variable that I
should set to redirect this? (I already have TEMP and TMP defined)...

>Gives a whole new meaning to 'hard drive' as well...

Strange, I finally convinced my father to purchase a used 1040ST, both monitors and a 50meg hard drive. It has 1 meg ram and TOS 1.0. I've had no problems with it at all, everything works fine including the hard drive. The ram is so limited I don't have Fatspeed installed, but he does not do many file copies anyway so he does not notice the slowdown on writes much.

Is there something I did wrong to make this work right?????-)))))

Source record: 202372
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello all,

I just got a nice new laser printer [Okidata OL830+] and am having some problems getting proper printouts from Atarai Works V1.2. The printer is postscript and HP LaserJet II compatable. When I print a documnet sometimes [rarely] the printout is perfect, but most of the time in the middle of a line of text [say Times at 36 point] there is a buch of regular ascii [default printer] characters mixing with the bit image text that Speedo Gdos was sending to the printer. It seems that the byte stream of pixel data is sometimes being corrupted. I am using a shieled printer cable.

I know the printer works fine since it prints out long TeX documents fine using both the dvi_lj2.ttp and dvi_ps.ttp drivers that I have. both of these programs send as much data to the printer as Speedo-GDOS does but theyt work fine. I also printed out large postscript pictures with no problem.

I should mention that I tried the SPeedo laserjet driver with both Atari Works and with Wordflair II, with the same poor results. Any help would be much appreciated! It is a shame to have such a great printer and have Speedo crap out like its doing.

Cheers,
Scott Kolodzieski

I thought you could run DOS programs under Linux. At least use OS/2, those tools should be easy to port form UNIX (and should already have been done right??).

>The Atari is really great for GNU stuff, thanks to Bammi et al. The PC
>world still doesn't have quite that level of support, possibly because
>there are more strong commercial alternatives.

You might be right here. I don't use the x86 versions, so I guess I wouldn't really know....I was just going on what I've heard said in some of the x86 os groups.

>>Why would you want to blow $300 to run ST software if your one of the
>>"statistically speaking" crowd and not a former ST owner.
>
>Well, I was assuming there was something to recommend the ST such that
>people might want to run stuff that's written for it. If that's not

>ST, despite having used it heavily for years. Personal taste.

Don't blame you. I HATE the ST keyboard...and espcially hate that
it doesn't detach. I COULD buy the adapter....but like you, I'm
not really putting much money into my Atari. I squirmed and bought
a cheap NeXT instead. Atari might have sold me a Falcon if they
were three months sooner and it had a detachable keyboard.

>>Why don't you just set up GNU to do a cross compile and run the

>(But you do still have to carry the binaries over to the ST to test
>them, which is sort of a pain.)

I've not done it...though I know it's possible. Someone recently reiterated
the steps. I haven't done it as I don't really have the HD space to spare on
my cube...plus I don't have a working floppy, so transfers are a PAIN.
I don't see the point of you mentioning that you need the ST libs. You need
them if you use Gemulator too. Same diff.

>>Hm. You ALREADY have a 486 as well. If I had to buy one, or had

>I'm not going to get sucked into this again, but look in Computer
>Shopper and you'll find that you're off by about 500 bucks. Nuff'
>said; I'm still weary from the last battle over prices. :)

I am too. I wasn't a participant in those debates though. I expect
my problem is that I don't classify a 486SX as a 486 (ok, it's
a personal quirk). I also insist on a little quality in the system if
I'm paying 1,000+. Hey my ST is quirky but I paid $150 for it and
dropping it from 2 inches always makes it work again! I wouldn't do that
with my cube in a million years!!

>>It is nice to have the alternative of Gemulator....but I still don't
>>see it as an "upgrade" path for ST's. Someone who really wants a

>
>Maybe I'm just a weenie (no comments from the peanut gallery!), but I
>really don't want to buy another expensive-to-upgrade Atari machine. I
>mean, I bought a 486 motherboard for $185 for my clone. I couldn't get
>a fast Atari-compatible motherboard for anywhere near that little.
>There's less competition, less standardization, less technical wizardry
>(quantity-wise) in the Atari market, just because the Atari market is
>so small. These less's make things cost more.

I can't deny what you say. Of couse..I do like the comment that someone
who bought a TT is still satisfied but a x86 owner or a Mac owner has
had to upgrade to keep perfomance. The x86 world keeps changing what's
hip. What's next....a PCI motherboard? I guess I'm really just jealous.
I sometimes have $200 to spend on spiffy upgrades...and it'd be nice to
have such a wide variety of toys to choose from. I like to play with
new toys. (I don't mean to be derogitory if that's how it sounds...
that's just how I refer to spiffy new hardware.)

>Atari's Falcon is nifty, as I'm sure their forthcoming machines will
>be, but you pay a price for owning "3rd party" hardware: fewer, more
>expensive upgrades, slower machine evolution, less software available,
>and funny looks from the 98% of computer users that have never heard of
>your machine.

But that's half the fun! "You own a WHAT?" :) Some people do like to
be different. Like me...a proud owner of an 030 cube.

Maybe not the whole thing but the processor which - as I've been told - will be
offered to be produced in license under Atari.
Of course more companys will want to get this license when the Jaguar hits the
market like a bomb (Hmmm, German phrase, don't know if it's similar in English)

It ___DOES___ look like a toilet!

The guy that designed it must have had bladder problems or something.

I think if they rounded the top part off a bit in the back, it wouldn't
look that bad. It isn't too late to change the CD-ROM unit.
They don't plan to make any until next year. And the way that software
development seems to be going, there won't be any CD-ROM software until
the end of next year anyways.

Good questions. I would like many of these answers myself. I too have a Megafile 60 and I found the best thing is to use hdx3.02 instead. It 'knows' about Megafile 60's and boots the hard disk up a lot faster (without the annoying messages).

2916. C-Kermit 5A 189: End of thread

Newsgroup: comp.sys.atari.st
Date: 1993-08-20 21:33:29 UTC
From: sourada@iastate.edu
Message-ID: <sourada.745882409@vincent1.iastate.edu>
Source record: 202378

To stop the back-and-forth of people who don't seem to know what they're talking about, C-Kermit 5A 189 is available in binary form (as well as source, of course) for the Atari ST. It is reasonable to assume that it has been out as long as the other versions, since Kermit News lists the ST along with the various other computers...

As was pointed out earlier, everything can be found on watson.cc.columbia.edu (aka kermit.columbia.edu).

And yes, I have downloaded the binaries, yes, they are 189, and yes, at least on some connections, it is now faster than Zmodem (and I will therefore switch from Zmodem to C-Kermit myself...).

Later,
Steven Ourada

I've been wondering the same thing. The way I see it, the current
PC market is getting very similar to the mainframe industry of the
1970s. Those 900 numbers for user support are another bad sign.

>is or should be a replacement for an original ST. However, in my case, the
>GEMulator has allowed me to complement my 1040ST and continue to use some
>of the more hard drive intensive software without much more expense.

Ok, if you want to talk cost, let's make something clear first - who is the targeted customer for this GEMulator product? Obviously, someone who has a lot of money already invested in ST software. Such a person is also likely to have a substantial amount of money already invested in ST hardware. Is it likely that this person is now going to shell out bucks to invest in a complete PC system, and then also purchase a GEMulator, just to be able to run a fraction of the ST software on it?

For most ST users, the cost to be able to use GEMulator has a floor of $500 to $1000, to obtain a usable 386-based PC system. Who knows what kind of video and disk controller cards you'll get in such a machine, what kind of memory size, etc... On the other hand, the raw components are the same, and cost the same. Why buy a PC with 8MB of RAM, when you could simply put 8MB into your ST? (In particular, why buy a PC with 8MB of RAM when most applications still only use 640K; the extended RAM can only be used as virtual disk, file cache, and swap, most of the time. Not that an 8 MB disk cache is bad, mind you, but it *is* a little silly when you really want to be using a large program on a large data set...) If you want a high density floppy drive, it costs the same to buy the mechanism, whether you install it in a PC or an ST. If you buy a PC disk controller, it typically will only handle 1 or 2 each of floppy and

hard drives, whereas a SCSI host adapter for an ST will allow you to connect 8 SCSI devices. Sure, you can buy a SCSI controller for a PC, but it's much more expensive, less compatible, and much slower than an ST, unless it's a Localbus card, but the cost and compatibility problems are magnified then. The argument that a stock PC has equivalent hardware at a cheaper price is just flat wrong - it may have the same hardware, at the *same* price, and still in some cases, the ST will be cheaper to upgrade.

Awesome. So does this mean I could buy one of these on my trip up to
San Francisco Labor Day weekend?

><<Andy Eddy>>
>To quote from Atari's press handout, the Jaguar has the following features --
>
>* 64-bit RISC multiprocessing architecture.
>
>* High-speed (106.4 Mbyte/sec) 64-bit data path

What a weird number. 106.4 / 8 bytes -> 13.3 MHz. It's not an even multiple of
the NTSC colorburst frequency (3.58 MHz), it's *almost* an even multiple of the
PAL colorburst frequency (4.43 MHz, 3.00226 times faster. But I'd figure a
power of 2, a divide by 3 doesn't make much sense...) But, it's nice to know
that the bus is a single-cycle architecture, no delays between transfers of
words. Very nice, that gives it an effective throughput equivalent to a
conventional (68000, 68030-style) processor running 4 to 8 times faster...
(Factor of 2 for the doubled bus width. Gee, theoretical performance equivalent
to a 106 MHz 68030. Awesome!)

>* Five processors:
>
> > 27 MIPs Graphics Processor with 4K bytes of zero wait-state internal
> SRAM that is closely coupled to the blitter, that can perform a full
> range of graphics effects (including shading and rotations) at high
> speed, yet is programmable for maximum flexibility.

(PS - the 'S' is significant in "MIPS" - it stands for "Second", it's not
their to indicate a plural...)
>
> > A programmable Object Processor that can act as a variety of different
> video architectures, such as an advanced sprite engine, pixel-mapped
> based systems, character-mapped based systems, and many others.

Sounds cool...
>
> > 27 MIPs DSP [Digital Signal Processor] with 8K bytes of zero wait-state
> internal SRAM for CD-quality sound and full stereo capabilities.

Hm. Both rated at 27 MIPS. Must really be 26.6, someone is taking liberties with arithmetic rounding. Still, impressive, a super-scalar architecture - two instructions per clock cycle. Hm. Integer only though, no mention of floating point performance anywhere, and it's now quite common to have multiple execution units in DSPs and RISCs...
>
> > A blitter that can perform a full range of logical operations at high
> speed, with hardware support for Z-buffering and Goudraud shading.

Interesting, not sure I see how Gouraud shading is done in a blitter, but so it goes... No mention of whether or not the blitter is also a 64-bit device, but one would assume so, in order to keep up with the 64 bit bus... Very cool, having both a blitter and a sprite engine...
>
> > MC68000 CPU clocked at 13.3MHz as a general purpose control processor.

Hm, and if you were really craven, you could easily pop in a 12.5 MHz 68010 and build a VM-based computer out of it. This is getting Really Interesting...
>
> [Five processors do not equal five chips; see below]
>
>* Lifelike quality 32-bit color on NTSC or PAL television screens, yielding
> greater than 16 million colors (16,777,216 exactly).

32 bit? What does that mean, considering that 16M is only 24 bits? Very odd.
>
>* Screen resolution of 720 x 576.

Must be provision for an RGB output as well, else the vertical rez is wasted in the US. Of course, PAL has 625 scan lines, so I guess it's good for the Europeans... (Ah, I'm so glad I can tweak the scan rate of my 27" TV. Could be in for some way cool video games...) I hope they include both a regular composite and an S-video output. And again, RGB would be nice too...
>
>* ROM cartridge capacity to 48 megabits [6 megabytes] of compressed or
> uncompressed code. When compressed, equivalent to almost 400 megabits.
> [50 megabytes?!?]
>
>* 16 megabits [2 megabytes] of fast page-mode DRAM.

Nice, but eventually you have to put the uncompressed objects *somewhere*. And with a resolution of 720*576 with 3 bytes per pixel, you're talking over a megabyte for a single screen. I would guess, they figured on eliminating the need for double-buffering by providing for hardware scrolling. (Since typically the most time-intensive operation is updating a scrolling background, that's usually the main reason to use double buffering. If the background scrolling can be managed in hardware, as it was on the 8-bit Ataris, then the big time and memory waster is eliminated...)
>
>* An optional double speed CD-ROM drive. ($200, sometime during 1994)

Just as an aside, I saw a photo of the new Apple CD drive in one of my stereo magazines. Talk about cheesy looking, I'd never buy something like that

for my home audio system. And yet, they're hyping it as an audio/video/photo
product, not just a computer peripheral. Blech...
>
>* ComLynx I/O for networked multiconsole games (even with Lynx and Jaguar
> mixture).
>
> [I smell a Lynx adaptor for the Jaguar in here. And the idea of chaining

Well, it had a sleek look to it, so it was certainly designed by someone
other than an electrical engineer. }-)
>
>* High speed synchronous serial port for connection to modems, cable TV,
> networks and other high performance networks.
>
> [No word of the rumored built-in modem. Darn]

They're probably still talking about a DSP-based software modem, like they
talked about for the Falcon. Could probably be done pretty easily... Hm.
The 32 MHz DSP 56001 in the Falcon is supposed to be able to execute 3
instructions per cycle, 96 MIPS. This DSP is only running at 26.6 MIPS,
although it can operate on more data at once (nearly 3 times larger word size).
Dunno...
>
>There are two custom chips, code-named Tom and Jerry, which combined contain

Hey yall I am curios if anyone else has this problem. I have a 4meg mega/STe w 68882 FPU and using Speedo gives me probs.. The two probs being that I cannot
configure my printer drivers or build width tables. when I goto those menus it does the bee like normal then the arrow comes back and the machine locks minus mouse movement... I do not know what versions I have, but the disks have Rev A stamped on them...

When I get new fonts or build new width tables I detach my HDD and attach it to another Mega E here at the house... But I have removed the FPU, PAL and replaced the jumper andi t works fine so I know its the FPU...

Cookie jar shows it as $00010000. And SysInfo shows it as a SFP004 or compatible...
Could it be I have the wrong PAL? I got it from a Atari dealer so I doubt it...

wonder what the chances are of atari updating those ACCs... :)

thanx!

To me, it sounds like they've got a 68000, a 64-bit-wide blitter chip, and
a 64-bit-wide DSP chip. So I suspect it's not really a "64-bit" processor,
in the sense that the r4000 or alpha are, but, instead, has 64-bit operations,
like any decent DSP these days.

Oh, ya the Portfolio was released in '89..winter I belive. I remember
reading about it in the WaldenSoftware ComputerBytes (Or something like that)
newsletter back then.

The 1450XLD sounds AWESOME! I wish I read more magazines back then.
I had a Commodore 64, but I infrequently only bought Commodore magazines
and Amiga magazines from '85 on... didn't really start reading mags a lot
until '89 or so. I missed out on a lot. I used to think my c64 was the
greatest 8 bitter... I bought an Atari800XL a few years ago, and it
surprised me! Built in 300 baud modem and a speech synthesizer? Wow!
How much did it go for?!

>Steven Ourada --- sourada@iastate.edu

So why don't you post them to A.A. or a site were every one can get them,
I would not have a clue how to get them from Columbia or what Directory they
might be in or there masive Help files that are there..??

Is there a mail-server than I can use that has the Atari C-Kermit 5A 189
binaries, note: there are more than one binary and the Doc's...

Thanks.....

Roger..... sheppard_r@kosmos.wcc.govt.nz

You can. Dosemu under linux is getting pretty good now. However, you
can also maintain both os's on the same machine, and booting between the
2 takes not much more time than booting between mono and colour modes on
an ST.

>buy an STe w/8MB's and a monitor. A LOT. $600 for instance (used prices
>no doubt) max will get you a killer ST system.

I challenge you to come up with this "$600 killer ST system". I suppose
you can MultiTOS on this system? Or Calamus SL? All on a $600 system?
Used prices, no doubt. Fire sale prices, no doubt. A used ST with a couple
meg of RAM sells for $300 to $400. Add a hard disk, a couple of monitors,
and you're still under $600? Bull!!!!! New prices you're looking at $1500
for such a system, and you can buy a brand new 486/33 with hard disk and
SuperVGA monitor and Gemulator for $1500. So economically it costs the
same to buy just an ST, or a PC with ST emulation. A PC emulator for the
ST will put you out hundreds more and not even provide 486 emulation.

Also, claiming that MIDI is 90%-95% of the MIDI market is more bullshit.
What you meant to say was that 90%-95% of the Atari ST market doesn't
give a damn about MIDI. It's a niche market and there's very little demand
for it, thus it was never added to Gemulator. Most people did not buy an
ST for its MIDI capabilities. If you dispute that, then explain to me why
MIDI is not discussed in 95% of comp.sys.atari.st messages?

This is not a flame mail, I'm just pointing out that you really don't know
much the product. Send me a mailing address and I'll send you more info.

>that this person is now going to shell out bucks to invest in a complete PC
>system, and then also purchase a GEMulator, just to be able to run a fraction
>of the ST software on it?

I see 2 arguments against this. The first, and simplest, is that
Darrek has been marketting this now for over a year, and is still going,
so I would assume he's making some money from it, thus proving there is
a market.
The market, I would guess, are those who, as Howard says, have a
substantial investment in ST software. Considerably more than the cost
of a Gemulator. These people would also have to have decided that their
future needs would no longer be served by Atari, and they've decided the
PC platform is the one offering the best future for their needs. If the
replacement cost of their current software is more than the cost of a
gemulator, then it makes sense to ease the transition, as the resale
value of Atari software is in my experience so rediculously low as to be
negligable.

>will take up a bit of memory, but this is better than frying a partition!

With TOS 1.4 or newer, you shouldn't have to worry about frying a
partition because you don't have enough folders allocated. If you don't
have enough, your ST will tell you by locking up with a message in the
upper left corner of the screen.

FWIW, I have 200megs of hard disk space with only 100 folders allocated
(40 that TOS allocates by default, plus 64 more via ICDBOOT). Haven't
fried a partition in ages.

Also, I would recommend that if you have 50megs or more of hard disk space
that you upgrade to at least TOS 1.4. The better GEMDOS code will be
something you and your hard drive will love. I'd cringe if someone said he
ran a 100- or 200meg hard drive with TOS 1.0.

Thanks for the ICDBOOT details, Mickey!

Well, he surely has made *some* money on it, but I wonder how many units
have actually been sold? I believe Darek earns his bread 'n butter working
for MS. He's not doing the GEMulator for a living... it appears to be
icing on the cake for him.

Also, the product itself is marketed by Purple Mountain Computers, right? I
believe they are also a computer dealer above and beyond the sale of the
GEMulator, so likewise, they wouldn't absorb a massive loss of income if
no GEMulators got sold at all.

So I think the product may persist partially because the company(ies?) backing
it can afford to lay this product at the feet of the masses and see who
snarfs it up. :)

<and to be clear about it, i think this is best way for ANY company to function
in a market as small as Atari's.. much less in the market of ex-Atarians who
go PC...>

[stuff deleted about the ridiculous low resale prices of used STs]

That really does bug me at times... my Mega ST 2 w/16mhz accelerator is
probably worth very little so I'll probably wind up keeping it whenever
I get my PC/Falcon/or both.

But really, this happens on every platform...the CPU dwindles in cost as
newer ones come out, but peripherals tend to decline in market value at
a slower rate. (with the exception of MAYBE hard drives!)

I called ICD once directly to ask them the same question, basically:
"Is there a rule of thumb for settings?" and they said , "No." What
I was told is that you should run CACHEHIT regularly to see the results
of your current settings and if you're not satisfied, then make some
adjustments bearing in mind that you lose available RAM if you increase
the numbers...

That's it. It's strictly subjective.

>like any decent DSP these days.

"64-bit operations" ? That is, by definition, what constitutes a 64 bit processor. What are you trying to say? Atari doesn't bill it as an R4000 or Alpha, they come right out and say it's a custom DSP. They didn't set out to build a general purpose microprocessor. Sounds like you were trying to look at it as one, and got disappointed. Much like the folks who tried to turn the i860 into a general purpose microprocessor. "Big Mistake."

It's a video game processor. It doesn't need all the fancy memory mapping, memory protection, context-switching stuff that a contemporary general purpose computer is expected to have. My comment above was simply a bit of speculation on capabilities that a hacker like myself might like to explore. Completely tangential to the Jaguar's role as a video game machine.

Of course, there were hints that the RISC would be the main processor in the system before, and that's still not entirely ruled out. After all, a 6502 doesn't have an MMU or fancy context-switching hardware, but it could not only play games but also made an OK Central Processor...

I'd like to have dialup access to the files on my ST when I'm away from the house, e.g. browse text files from work or transfer GIF files, etc.

I've considered BBS software, but it seems like overkill; I'll do it if have to, but is there a simpler way? Can I dial in and run some kind of CLI perhaps, with XMODEM capabilities?

Anyway, recommendations for general approaches using TOS are invited; please E-mail, and I'll post a summary (there's enough traffic here!).

Oh, and recommendations for decent PD or shareware BBS systems are welcome, especially if I can freely access all disk volumes; ease of configuration is a highly desirable feature as well.

And one more thing-- I can't read German :-)

>"64-bit operations" ? That is, by definition, what constitutes a 64 bit
>processor.

Not really. Most current 32-bit RISC processors can do 64-bit loads and stores; it doesn't make them 64-bit processors. Almost every 32-bit processor has a 64-bit floating point type; being able to manipulate them does not make the processor a 64-bit processor. Similarly, most DSP's can do extremely limited operations on 56- or 64-bit values (load, store, fixed-point add/sub/mul/div, the occasional logical operation).

>Atari doesn't bill it as an R4000 or
>Alpha, they come right out and say it's a custom DSP.

Wrong. Read the official statements: it is described as having a custom 64-bit RISC processor. While DSP's almost always have a reduced instruction set, very few people call them "RISC," because they are not really general-purpose processors -- take a look at the instruction set: they're *very* specialized. (Although the Motorola and AT&T ones I've looked at *do* have the ability to work as GPP's [without an MMU or stuff like that, but, then, the 6502 didn't have one, either :)], and I suspect that the one in the Jaguar can, as well. But they're not *designed* to do that, and it shows.)

****

Well all of this confusion is NOT necessary. READ ON:

THE WAY IT SHOULD BE:

comp.sys.atari.8bit - 8-bit Atari's.
comp.sys.atari.st - Atari ST's
comp.sys.atari.falcon - Atari Falcons, all of them.

Not that hard is it? I know the issue of the TT will come up, I say use the
Falcon group for now, until ATARI re-introduces them and theres a need for a TT
group.

Does the bus have to be clocked at a multiple of some significant video
timing spec? I don't think so, unless you've got one master crystal
sourcing everything. It's possible that the transfer rate actually is
a multiple of the colorburst frequency, but perhaps 106.4 Mbyte/sec is
the average throughput.

>it goes...

If the blitter was capable of interpolating or adding some kind of intensity
gradient between the start and end of a scan-converted line, that would be
all it needs for Gourard shading. You'd just need start and end.

>>* Lifelike quality 32-bit color on NTSC or PAL television screens, yielding

>
>32 bit? What does that mean, considering that 16M is only 24 bits? Very odd.

If it can do transparency, those extra 8 bits might be used for an alpha
channel, which would be cool.

>>* ROM cartridge capacity to 48 megabits [6 megabytes] of compressed or

Seems like pretty good compression...almost too good. I wonder if they're
getting the number from compressed JPEG images... I've had good luck with
7:1 or 8:1 compression ratios before the image started to degrade really

noticably. On a TV, Probably no one would notice.

Yup, more pointless speculation! :)

It sounds to me like you haven't seen a Falcon, or that if you have seen one
it wasn't demonstrated properly. The Falcon TOS 4.01 had some problems but
later versions are in fact more reliable than older TOS releases.
There's excellent software support. For a start ALL my ST programs work on
my Falcon. These include ALL HiSoft products, STraight FAX, That's Write,
Calligrapher, NVDI, Everest, Connect, Stalker, ImageCopy, Diamond Back,
Diamond Edge, UIS, ARCShell, STZip, MultiDesk, Cubase, WordFlair, and more.
There are more than 1000-2000 users worldwide. There are probably more in
London alone.

Your tone is similar to your comments about Connect. On CIX (the biggest UK
BBS) there is general agreement that Connect is the best comms package
around. There are even scripts being written for it by UK users and someone
is already adding the UK call charges to the call cost calculator.

You will end up in everyone's kill file, so nobody except you will be able
to read your mis-informed messages.

From your comment I must deduce the following:

You have a 520ST with a single-sided external drive connected to an old B&W
TV. Wake Up !!! I always thought New Zealand was on this planet, apparently
not.

Hold the phone....

Who SAYS you HAVE to have WordPerfect 6.0 for $600 if you own a PC...??

I use MicroSoft Works, which came FREE with my PC, but is available for
around $79 retail (FAR less than AtariWorks, incidentally), and it's
a nice, "low-end" wordprocessor, PLUS database and spreadsheet.

Also, who says you have to spend $2500 to $3500 for a "decent" hardware
setup.. (even considering currency conversion) that is an excessive
figure for a "decent" PC. The system I built was just over $1000.
A very good ready-to-run system should run about $1200-$1500.

The equation that PC=Expensive and Atari=Cheap just isn't true anymore.

2960. Little Computer People?

Newsgroup: comp.sys.atari.st

Several years ago, there was a game called Little Computer People. There were versions for the C64, Apple, and Amiga. Seeing that there was an Amiga version, and the age of the game (1986?) its not too farfetched to hope that there was an Atari version.

Was there? And if so, if someone has it, and wants to get rid of it, let me know.

Thanx

Hello,

I have a friend that has an Atari ST (not sure of the other model specifics) and she's in desperate search for a genology program. Her husband has checked around this area (Tidewater, Virginia USA) and found no Atari support. If anyone knows of a commercial or shareware geneology package, please leave me e-mail with the details. As a matter of fact, if anyone has a list of Atari software/hardware suppliers/clubs/magazines, I'm sure they'd appreciate it.

Thanks in advance..

j_george@vger.nsu.edu

Yes, there was an Atari version of Little Computer People! When I got my
Atari, a friend who sold his let me sift through his left over discs. I kept
the discs I wanted, but not that one. I had no idea what it was all about...
actually, I still don't know what it is about.

To be fair, Bob, AtariWorks is selling for around $99 which isn't
really _FAR_ more than MS-Works. And AtWorks will do some things
that I don't think MS-Works will ever do, although most people may
think those things unimportant...

I still don't think you are reading in what I posted, you are reading some think in that is not there at all..

What I was stating is that its posible for Shops to produce EPROMS easly, but they would have to buy there ROMS from Atari, hence very little ROMS out there..

I was given a 6 chip set to install from a friend, I don't think that these EPROMS came from Atari at all, these EPROMS had been used many times before and were a Big mix of brands....???

I do know some thing about EPROMS and such like as I am a Electronics/Computer Engineer for about some 35 Years...

|> sourcing everything. It's possible that the transfer rate actually is
|> a multiple of the colorburst frequency, but perhaps 106.4 Mbyte/sec is
|> the average throughput.
|>

Look att the CPU (Mc68000) frq ,that's 13.3 MHz. Mc68000 only one half of
the total buscapacity (every two byscycle). Suppose the video-chip(s) are
running at 768*576 pixels and 60Hz that means a pixelrate of appr. 13.3Mhz
the pixels are however fetched two at a time (64/32=2). This means that both
the 68000 and video-chips can run at fullspeed and at the same time access
the dram without using sepate busses or such... How the blitter and dsp
is accessing the memory is another question. But a quess is that the dsp
is accessing memory when the videochip isn't that is "in" the borders
of the screen. Another quess is that the blitter is stealing cycles dynamically
from both video and 68000. But atari has made some awful solutions to this
problems before,think for example of the st-blitter it is blocking the processor
entirely it could have used cycles dynamicaly like the amiga-blitter :-(

The reason atari is using 13.3 MHz memoryfrequecy is that they want to have a
little "speedbuffer" between the max 14.28 MHz using 70ns Dram and 13.3MHz
(75.188 ns). I don't know any 75ns drams...

Footnote: When i'm speaking if "cycles" i mean Memorycycles,(the time it takes to
read one word from memory, in jaguar one word is 64-bit)

>ran a 100- or 200meg hard drive with TOS 1.0.

I'm using a 105 meg drive on an STE, and whenever I do a massive
file delete (a few hundred), the thing slows down towards the end
to a snails pace. Why is this?? Is it like that on all versions of TOS?
BTW: I've got Write cacheing on, it makes no difference with or without
it.

I'm deleting 100's of files every day, and it's a bit of a pain...
although i've automated it now so it happens while i'm asleep! :-)
(in case you're wondering, the 100's of files are news messages off
usenet!!)

Suppose the Atari folks for once are right and that
the machine has sold 7000 in the UK, 4000 in Germany
and perhaps another 8-9000 in the rest of the world.
(generous numbers, IMO)

Q: What does that mean ?
A: That it's a flop.

Who wants to support such low numbers ? How many
Falcon SPECIFIC titles are available ?

Well, what ST Report states has to be taken with a grain of salt, much like we all take Atari press releases or Bob Brodie when he says "Real Soon Now".

Let's look at what has happened to ST Report in the past few years... the "publisher" (Mariano) has constantly been at odds with Atari, in that he has felt the urge to play Citizen Kane and be a voice for the users to get Atari do something to make the machines successful. Soemwhere along the line, though, I think it has turned ugly, into a personal war between him and some of the other Atari people.

Ralph is not a bad guy, per se, but he is too eager to report something in the tabloid fashion. He's an alarmist. I don't know what is worse, an Atari cheerleader or an Atari basher, because both are about as deluded as one can get.

<someone writes>
>>Get a VGA monitor and there will be no flicker AT ALL.
>
>And no more True Colour or Overscan, gee I don't think you are with it at all
>
>PLUS I never posted any thing to do with Flicker at all, just a report
>from STR that there is a Big problem with interlaced screens, I do suggest that
>you go back and READ what was posted....!!!!

Blow it out your ear....and get the SCREENBLASTER demo from a.a.u.e;
Without any extra hardware at all (just an Autofolder program and CPX) I
can get overscan on my IBMPS2 VGA with no flicker in any collor mode
except TC. But the True Collor mode is usually needed to view pictures and
it looks AWESOME on an Atari SC XXXXX monitor even in interlace mode.
I have had my falcon for almost a month now and have not had ANY (read
that again) ANY problems whatsoever with the video; even with the screen
blaster demo. It really is a great computer! :)

Now at my site (to be put on atari.archive ASAP)

A special edition of Atari Explorer Online, the first Jaguar Edition.

Included are:
The main Press release and other info in a 33k text file, Jaguar Logo (.IMG),
Bus Block Diagram (.IMG) (have at it Howard Chu!), and 4 GIF's
(2 of TinyToons, 1 Raiden, and 1 Dinolympics)

Sadly, the GIF's are 320x200 and only 256 colors. :(
There are Targa's on GEnie, for the above, but its a big file, and it
costs me (LD charges) to call.

The AEO:PJ has gobs of programmers info, from beginners(begining C) to advanced
(FLEX)

You can get these files *now* by FTP'ing to:

rahul.net

and looking in the directory
/pub/wilsont

AEO02_15 should be out soon too.

Enjoy!

I agree that there should be a 'comp.sys.atari.falcon' newsgroup area. The Falcon and the Jaguar deserve more recognition than they have been getting. Simply a subject of another newsgroup area is not enough, we need to have an Atari Falcon ONLY newsgroup to handle all these extra mesasges. The Falcon is a brand new breed of ATARI, much like the Atari 520ST was back in 1985, now we have the new generation of computer systems. I can say I'm very impressed at what you get with the Falcon out of the box for the price.

Try to use ColdHardCache, it works very well although I wouldn't recommend caching removable media like floppy drives.

A full answer to your question would require a whole book... Instead let me just say this - if you can afford a Falcon get one, if not get a MegaSTE, if not then an STE. ST programs do not require much memory, so 1MB of RAM is enough, although 2MB is more usable. I have 4MB.

>Roger wrote:
>
>Who wants to support such low numbers ? How many
>Falcon SPECIFIC titles are available ?
>

The advantage of the Falcon is that it runs most ST programs. As far as specific titles go:

Cubase Audio
DigiTape
ScreenBlaster
BlowUp030
FalconSpeed
EagleSonic and MightySonic
Various fractal generators and similar
Chagal

ST programs that were enhanced to make use of Falcon specific features:

ImageCopy
Diamond Edge
HiSoft BASIC
Lattice C
GEMView
PhotoStudio

This is just off the top of my head, there's plenty more, I just don't have the time to go through the magazines.
I don't see the point of this arguement. The Falcon is a great piece of hardware, regardless of how many people buy it. For me, the availability of Cubase Audio alone is a good enough reason to buy it. If the Falcon fails it will be a loss to all users of all platforms, because competition is healthy. The last thing we need is for MicroSoft to totally take over...

2997. Re: Atari vs the EXPENSIVE world of DOS

Newsgroup: comp.sys.atari.st
Date: 1993-08-23 01:31:17 UTC
From: afonseca@terapin.com
Message-ID: <afonseca.0bjo@terapin.com>
Source record: 202165

Hmm.. Very intersesting message here.. It really got me thinking.. I own an ATARI 1040 STE, and am selling it to upgrade to a much bigger/better computer. The truth is, I guess I could keep this system and do what I need to do with it, but I want more for myself.. I want a powerfull computer with the ability to multi-task, and that has alot of great software to explore.

I naturaly am thinking of the Falcon 030. Its close to my STE in terms of the OS, and allows multi-tasking, etc.. But I would love to be compatible with the "industry standard".. Being able to say, yes I have Word Perfect at home.. Or being able to go to almost any store and browse through a library of software, with many new titles. I can either get a Falcon 030, or an IBM 486. Of course the 486 would be alot faster, more powerfull, offer better graphics, same sound.. I don't know if there would be very much of a price difference either.. And I would instantly know ALOT of people that I could talk to about computers without them saying, "ATARI makes computers?", and being able to share files.. If I got a Falcon030, I would have a computer I feel more confortable with, always having used ATARI's from 8-bit to STE, and being different from the rest. But there isn't much software, and no security.

I am currently saving up money to buy this new computer, whatever it is.. By the time I have enough I will make my decision. Right now, I'm keeping a watchfull eye on all computers.

What about Mac and Amiga? Some may be wondering.. Mac is a great computer, but not as supported as IBM, simple as that.. Amiga, is like ATARI, very iffy, and I don't like it.

I know alot of you only need a computer to do what you NEED to do, or maybe some may need it to do specific things.. For me, computers is a hobby. Yes, I need to do Word Processing, Telecommunications, Programming, and games.. Thats all I NEED to do, but I WANT to do much more.. I have not decided one way or another, but IBM is looking good again. I've been swaying back and forth for a while, but it is my money, and I've had to save for a while, I have to make the right choice for me.

Any comments welcome.

Ok, if AtariWorks is actually retailing for $99, then $79 for MicroSoft Works isn't "FAR" less... (the last I heard, Bob Brodie had been saying it would be priced at $139).

And yes, MicroSoft Works includes a Telecommunications module (which I don't use), and Charting of data from other modules (which I also don't use, and thus forgot about).

The point being, (not a comparison of features with AtariWorks), that you don't HAVE to shell out $600 for WordPerfect, as the original article seemed to imply, if you want wordprocessing on a PC.

"Chaos Strikes Back" was considered an "Expansion Module" for
Dungeon Master, even though it was truly a full standalone game, but not
a "II" version of the game.

I wasn't aware that a "Dungeon Master II" had been released on any other
platform... I'd be interested in any info about it...

BobR

3002. A few more things about the Jaguar...

Newsgroup: comp.sys.atari.st
Date: 1993-08-23 03:46:38 UTC

Source record: 202168

Some stuff derived from an article by John Enders (AP writer) printed in the Sunday, 22 AUG 93 Rocky Mountain News (Denver, Colorado, USA):

- "We've never believed in launching incrementally better designs. You really have to make quantum leaps in perfromance," Richard Miller, Atari vice president for technology.

- It will be introduced in New York and San Francisco by the end of the year, with a nationwide launch in January.

- The two main microprocessors in the Jaguar have 600,000 and 750,000 transistors per chip, respectively.

- "These two chips took about three years to develop." Miller said.

- Atari predicts that 80 percent of its `94 revenue will be generated by sales of Jaguar and Lynx. They hope to rejuvenate Lynx sales by heavy advertising. "We plan to market and advertise Jaguar very, very. heavily. We realize that's been our weakness in the past," said Atari President Sam Tramiel.

- Atari will spend $3 million on marketing in 4th quarter `93 and $45 million in 1994.

- In 1982, Atari had 10,000 employees and $2 billion in sales; in 1992 they lost $73.6 million on sales of $127.3 million and laid off more than 10 percent of its 500-person work force.

- At the end of fiscal 1992 Sega sales were $3.62 billion; Nintendo had sales of $4.9 billion.

- Atari says it hs about $40 million in cash on hand, enough to launch Jaguar, and is consdiering going to the public for additional finance in 1994.

- The combination of the Jaguar's $200 price tag and the 64-bit tech-nology is "totally revolutionary" said Bill Kunkell, executive editor of _Electronic Games_ magazine.

Source record: 202174

```
Camera pulls slowly back to reveal:
Close up shot of the eye of a live Jaguar.
Drums start beat.
Jaguar begins to run, zigging and zagging; camera follows.
Drums beat faster.
Jaguar jumps high in the air, as if pouncing on prey.
Jaguar gutteral roar.
Halfway through leap, animal Jaguar morphs into Atari Jaguar.
Roar heard throughout morph, with echoes.
Closeup of Jaguar landing on top of color monitor.
Camera pulls back to reveal:
Computer generated image of animal Jaguar running on screen.
Camera continues pull back to show:
Two teens playing Jaguar "game".
Fade to black with super lettering in white:
JAGUAR (fade to) ATARI (fade to) TOMORROW (fade to) TODAY
Fade to black. Drums in background over entire ending.

Hi there, I did not see your name in your post but was it Ofir..

I am puzzed in why people don't understand that my comments about the Falcon. is just my opinion..

Why is it that people are so defensive about there Falcons, or is it that I hit on a raw nerve, and they wished they have never brought one in the first place..

We have been biten here in many ways, there were a few TT and MEGA/STES sold here but with the old TOS's and now they find that they can't upgrade the TOS here or Fit 1.4 meg disk drives...

Commodore C64 sell for 100% more that a ST or STE here....

Kmart here just dumped there stock of ST's for $140/200nz that is about 70 pounds for a STFM...

We no longer have any one selling Atari or uptodate Software here...

I have read in a number of places that the 16 bit sound on the Falcon is not upto scratch, no better that a good tape recorder, this has also come from some German midi Software firms....

I have had Ataries from way back, I now have 2, but no they are not 520 with single drives and 1/2 meg of ram...

And they are not Mega STEs or TT, the price they whanted for those were a rip of here, more like 5 * the Pound price, and we never got the reduced price here when it droped for those machines in the UK, I think are agent folded then....

PC Clones here are cheaper than any were in the World, as there is no Duty on them, just 12.5 % GST/VAT..

a 486DX2-50 with 170 meg HD, 4 megs of Ram, 2 VERSA slots, Local buss video car, True Colour, programble monitor and with DOS/WINDOW/WORKS for 1000 Pounds plus 12.5 % Tax...

A Flacon would be at least $3000nz and with out a Monitor...

Food for thought.....

Roger..... sheppard_r@kosmos.wcc.govt.nz

>You odds of a game working on GEMulator are infinitesimally small.
>
>How can you expect a game to work on an emulator when 90% of them
>don't even work on a TT, and heaps not on the MSTe!
>
>GEMulator is for GEM applications only. Take a look at the list
>of compatible software in the original posting.

The above statement is half right, half wrong. Games do not work on Gemulator due to several things: timing factors, copy protection, TOS version dependancy, etc. Just like the TT, MegaSTE, and Falcon do not run many games designed for use on the 8 Mhz 1040ST, neither does Gemulator. It does not exactly emulate an 8 Mhz 68000. The clock speed varies with the PC you are running on. So any software that depends on tight timing loops might break. Copy protection is a typical case of that. Also, many games were written for TOS 1.0 or other non-2.06 versions of TOS. Gemulator comes bundled with TOS 2.06 ROMs, but certainly there are sockets to plug in earlier versions.

However, saying that Gemulator only runs GEM programs is absolutely false. That implies that Gemulator hooks into GEM and emulates the calls, similar to what NVDI does. WRONG!

Gemulator completely emulates the underlying ST hardware: the MFP, the sound chip, the ACIA chip for the mouse/keyboard, the video chip. You can read and write any hardware register that exists on a real ST. The TOS ROMs themselves are just run as any other 68000 code. There is no distinction between the TOS code and any other 68000 code.

Look again at the list of compatible programs. TEMPUS II is an extremely hardware dependent program. It pokes directly to screen memory and the video chip, (and thus fails to run on the TT or Falcon in non-ST modes) but it runs just fine on Gemulator.

Look at Flash and other terminal software. It writes directly to the MFP chip to do the serial I/O. Gemulator translates hardware accesses to the MFP to the equivalent hardware locations on the PC.

Look at Hotwire, Warp 9, NVDI, Multidesk, Geneva, MultiTOS, etc. They call hook GEM, replace GEM, access hardware

directly, and they are all 100% compatible with Gemulator.

Even several video games do run. Arkanoid, Silent Service, all the Infocom stuff, Chessmaster 2000, Flight Simulator, etc. So you can't even make a blanket statement that games don't work.

So before you go making any more stupid statements Warwick I suggest you read the literature. You obviously haven't seen the product, or seen the demo video, or read the newsletter.

|> and they are allmost rubish..
It's not so different in the UK. The only mag that is easily bought is ST Format which is a pity as it is trash. Inaccurate and written by people with no knowledge of the ST scene. ST Review & ST User are a lot better the former especially but these magazines are sold as firm sale only so a lot of shops don't bother stocking them. That leaves subscription or asking the newsagent to keep a copy each month. There are about 8 maybe more Amiga magazines that fill the rest of the shelfspace.

|> Have a look at the Amiga 1200 HD, Price its nearly 1/2 of the Falcon, to me the
|> Falcon does not warrant a 100% price hike over the Amiga 1200 HD, I do think the
|> Amiga has far more to offer and is more compatible with software than the
|> Falcon is..
Very cheap machine. About 299GBP last time I looked. Actually rather more than 50% cheaper! After speaking to my Amiga owning friend, it would seem the alcon runs more applicationd and the Amiga runs more games, but only just. A lot of stuff breaks on the 1200. I did look at the 1200 when I was shopping for a new machine but heard so much flack about it from Amiga owners to the effect it was released in a half baked form, I decided to leave it.

|> Here you will not find any Shops at all Selling Ataries even Music Shops
|> here are pushing the Mac and the PC to do that...
|>
The UK still has a predominately ST/Falcon music scene with a lot of Falcon only MIDI stuff already appearing. The PC/Mac are increasing market share though at the moment. Having said that, Cubase for Windows is not very good at all by all accounts.

|> Please if People read in what I post, they must aggree, but then again People
|> can't read, or they are just lying to them selves...
Sorry, I don't understand what you are saying here

|> I enclose this part about Screen Problems taken from ST-Report 933..
I was not aware of this problem. Still, few Falcon owners will use interlace and the overlay bit so it's hardly a show stopper. Anyone that uses a Falcon for video work where they will be using the overlay bit, will have a decent monitor and not require interlace. 1024x768 with no overlay is acheivable no problem.

>2. Can't read some copy protected disks (ditto).

Can't help you there. It's partly the same reasons the
Mega STE, TT, and Falcon can't run some ST games.

>3. No MIDI (though I don't think anyone would buy it for MIDI anyways).

A few people would, but not enough people have requested MIDI
to warrant weeks or months of work for a handful of sales.

>take this to mean that it easily could support Spectre, but Dave said
>"don't do it or I'll sue you". I think Dave Small is missing the boat
>here -- a mac emulator for the PC at this price would sell big in the
>PC world.

Actually, he said "I'll sue you" in 3 pages of text. He's really
gone off the deep end, but hey, for a guy who's been in bed
with Atari Corp for years, can you expect him to support a
product that competes with the ST?

>Anyways, if Darek could fix the joystick support, I'd buy one of
>these things.
>
>--
>Greg Bernath gbernath@oucsace.cs.ohiou.edu

Ok Greg, is that a promise? Joystick support is very easy
to add in and 3.0 doesn't ship for another month. Plenty
of time to add that feature. The question is, will you
be paying by check or credit card or would you like me
to just bill you? You know that I have your home address. <grin>

|> some advice about spec's etc. I need? How is it with the MIDI interface etc?
Get at least a 1Mb machine and ideally 4Mb. In the UK, a 4Mb STe is 299GBP complete with Pro24 III sequenceing software. There are a great many MIDI apps available, squencers, direct to disk samplers, sample editors, voice editors, composer aids, music DTP and much more.

Loss of True Colour is a pain but I never use it anyway, 256 colour is fine for me. Overscan is only of use when outputting to a VCR or a TV for display purposes and in both these cases, it will overscan. Don't thibk of overscan as a set of extra pixels for free, that's not what it's about. It's for removing the borders when outputting to video.

It just sounds like you need a good distributor/dealer in NZ, the hardware's
fine. The audio quality is very good, comparable to a domestic CD player.
However, for pro use, it is possible to bypass the a/d and d/a convertors
and record in the digital domain, so audio quality is not an issue.
I think that if you have a Falcon for a few days you'll never want to give
it back.

Just my DM 0.03 (that's approx. $0.02), I don't mind the Falcon
messages, as the Falcon is an ST/TT compatible (well, to some
quite large extent), but I have little interest in all that
Jaguar stuff that's coming up lately. As I see it, th Jaguar has
nothing to do with ST(e)s, TTs and Falcons, except it comes from
the same corporation.

>By the way, does anybody know if there will be a Duesseldorf Atari Messe
>this year?

It seems that there will be no more Atari Messen anymore :-(. A
dealer told me that this was due to the restructuring of the
European branch of Atari -- it seems that Atari Germany was
shrinked, and that a new European central located in Rotterdam,
NL is going to take care of most of the European market.
It seems that Atari Germany used to organize the Atari Messen,
and since they don't exist in the old form anymore, there will be
no more Atari Messen.
I was told that Atari now plans to present their products in a
lot of local fairs and shows. The Atari management didn't like
the Messe because cheap vendors dumping hardware at the Messe
always attracted most of the attention.
Another question, does anyone know if there will be a CSS
(Computer Shopper Show) this year. Last year, such a show was in
Cologne, and there were quite nice deals to be made (scanners,
mice etc. -- perhaps just the kind of stuff the Atari officials
didn't like...). Most of the stuff was for Amiga, though.

Hi,
you know the problem... Partition E: or F: or X: is crashed...
"Drive not responding"... Okay, it's an error in the AHDI driver...
But now you got your new driver... and it's crashing another time...
what's wrong..? You got an "old" Falcon... there is a problem with a
wire... this wire too near of a magnetic spool... and so, all data
is magnetisized... and you know what this will mean... you do not?
okay, hold your favourite gamedisk onto a strong magnet... and try
to load the game!!
what you have to do!!:
open your falcon and bend it away from the spool... first you have
to remove the coverplate... (or so!) or you give the falcon back to your
local dealer... or you order an other guaranteesticker... or you buy a
pc! (hehe)... or you commit a suicide... or you drink some coke...!
Greetings from the alps... DR. CH/|\OS

3029. Family Tree (really TeX)

Newsgroup: comp.sys.atari.st

3030. VGA simulator for TT mono?

Newsgroup: comp.sys.atari.st
Date: 1993-08-23 13:28:20 UTC
From: aeg03@rrz.uni-koeln.de
Message-ID: <25aglkINN1k1r@rs1.rrz.Uni-Koeln.DE>
Source record: 202196

Hi folks,

I have a TT with a 19 inch monochrome monitor, and I have neither the $$$ nor the space to afford a VGA monitor. Along with the TT, which I bought used, I got a program called VGA_SIMU, which simulates a VGA display on a TT mono monitor. However, VGA_SINU sometimes doesn't notice changes made to the screen contents, which leads then leads to a partial display of screen updates, or complete failure to display an update, if the changes are only small. All programs that do animations or similar things look like complete garbage with VGA_SIMU. Does anyone know of an update or an alternative to simulate a VGA display on a TT mono display?

Greetinx & thanx in advance, Jan

>Falcon SPECIFIC titles are available ?

I think I have to agree that the Falcon is not living up to expectations. An estimate of 20,000 units sold so far is probably about right - just consider Ataris' present quarterly turnover figures (10 million dollars), matches about 20,000 units. I saw the Falcon a year ago at the German Atari computer show and as far as I feel, the Falcon has been around that long and they've only sold 20,000 units in that time, also the price hasn't changed, far too expensive. The falcon is already one year old technology, Atari should be thinking about producing an updated model NOW, otherwise it will go the way the TT went, too expensive and too late. With Atari more concerned with the other animal, I don't suppose we're going to see much falcon support from them. If the basic falcon (no memory please, their board is a waste of time - get one of the new simm boards), were 400 pounds I'd probably buy one.

3032. Problems with Civilization (the game)

Newsgroup: comp.sys.atari.st
Date: 1993-08-23 14:23:47 UTC
From: doucet@ripolin.laas.fr
Message-ID: <10096@laas.laas.fr>
Source record: 202200

I've got some problems with Civilization and was wondering
if anybody else have resolved (or at least by-passed) them ?

(Before starting mourns, I'd like to say I've spent *many* hours
playing Civ with much pleasure. But...)

The more frustating: by the year 1950AD, having discovered all
the advances, I make many of my cities to construct SpaceShip's
parts: modules, structurals, components. Each time, a city
completes its job ("Somewhere constructed SS Component"),
I get a black screen with the following text:
docker.lbm
Program halted.... 0
After a Return, I get to the SS control panel, and there the
parts of the SS are replaced by bits and pieces of some ministers,
or of the last advance I've discovered or... Anyway, nothing
that can resemble to any space ship part... The game
resumes from there, but without seeing what you're building,
it's almost impossible to complete the SS construction.

Another strange one: when a city has a population of 1, it seems
that there's no way for the game to find one of the advisors'
panel: disk drive goes into a *very* long search whose end I've
usually not enough patience to wait for. This happens when
trying to modify production either for my cities or for cities
I've just captured.
(Note: I have no HD, and play with some options: Animation,
Palace, ... turned off).

Yet another one: near the end (~2000AD), when trying
to change a city's production, I get the beginning of the panel
(with all military units) and a "More" option; clicking on More
usually gives the rest of the possible constructs the city can
make; but sometimes this "more panel" consists only of two lines
that say "more", one going nowhere and the other back to the
military units. From there, it's impossible to build something
else than a unit, but no more improvements nor SS parts.

Also, it happened twice that 2 bombs appeared terminating game
immediately: when restarting from a saved game, all went right...

I know it's wise to same game often and that's what I do.
However I'd like to have this great game working well on my comp:
520 STE, 2.5Megs, no HD, TOS 1.62.

Much thanks in advance for any help/hint;
also I'd like to exchange ideas with other Civ players.

That is fascinating. Think of how two player sports simulations could
be improved by including a "private screen" like an attached lynx for
input of selected moves or plays. Or several lynxen with first person
views, and a central screen with a "battle view".

I wonder how much market would be restricted for a game design which
requires use of a lynx (or three)? Might it be that most Jaguar
owners would also own lynxen?

<Almost exactly what I was about to post with before the link went down>

Roger wibbled:
>>Yes I think you should be in all the Worlds Kill files with comments like this,
>>how old are you, a kind of a comment from a Teenager...

ogal@cix replied:
>On the contrary, I actually get paid for writing my opinions. Wish I was a
>teenager...

Calling somebody a teenager seems to be the best put down good old Bodger can
come up with - you're at least the second person who has been wrongly accused
in the last few days.

However, beware - simply following up to Roger's articles will probably lead
some people to put you in their kill files.

>
>Ofir ogal@cix.compulink.co.uk
>

Oh, and I was going to ridicule the spurious capital letters he comes out
with when he gets excited, and the incredible 3 dots at the end of sentences
that have become synonamous with the phrase "The previous sentance was utter
rubbish".

I won't mention his spelling for obvious reasons :-).

I have the following Atari 1040 System. I'm looking
to sell the whoooole thing. I'll be moving soon and I really
don't have the room to take it with me. You can e-mail me
at jku@netcom.com.

System Description
- Atari 1040ST w/ 1MB Memory
- SM124 HiRes Monochrome Monitor
- SC1224 Color Monitor
- MegaFile 30; 30MB HardDrive
- Spectre GCR w/ Roms
- Monitor/Printer Stand
- 1200 Baud Avatex Modem; no serial cable
- Assorted Programs

I can delivery to anywhere in the SF Bay. I'll entertain
any resonable offers.

Later,
James

No, that's not Clive Sinclair; I'm refering to Peter Day-Sinclair, who hit an all-time high for offending as many people as possible by a triple re-posting of ca. 200 line message with no new remarks (not that anyone wants to read his drivel). Once several people complained about having to pay download fees for newsgroups, the epitome of clueless morons discovered he could strike at Atari owners wallets, and has had the bad taste to do so.

This same idiot consistently posts price lists for Mac Centris systems in this newsgroup, and otherwise snipes at the Falcon. The dunderhead (dumkopf) won't take the hint about posting such discussions in comp.sys.atari.advocacy, where we can safely ignore them, but persists in annoying us all, despite pleas for sanity by E-mail and in the comp.sys.atari.st newsgroup.

By all means, send mail to his postmaster, or you could try root as well; mail to sinclap2954@cobra.uni.edu does little good.

By the way, runner-up is that lovable Kiwi, Roger Sheppard :-)

Wednesday Night Real Time Conference

August 18, 1993

Host - Brian H. Harvey

Guest Speaker - Darek Mihocka
BRANCH ALWAYS SOFTWARE

<[Host] BRIAN.H> On behalf of the Atari ST Roundtable, I welcome all
of you to this BRANCH ALWAYS SOFTWARE Round Table Conference. Tonight
I would like to welcome Darek Mihocka to the ATARI ST RTC!

Welcome Darek, do you have a few words to begin this evening RTC?

<BRASOFT> Thank you for coming to the BraSoft Gemulator RTC. I'm
Darek Mihocka of Branch Always Software and the creator of Gemulator,
ST Xformer, and Quick ST. Gemulator 3.0 is an Atari ST emulator that
runs on DOS, Windows, and OS/2 based PCs, and emulates virtually 100%
of the Atari ST: the 68000 chip, 4096 color graphics, sound, 300-9600
baud modem port, printer port, mouse, keyboard and numeric keypad,
real time clock, floppy disk controller, hard disk controller, MFP
chip, and TOS. Gemulator can run Calamus SL, Pagestream, Pha$ar, GFA
Basic, etc. and most other Atari ST software.

Gemulator is an alternative to buying a real Atari computer and it
also provides enhancements over a real ST, such as higher disk
capacity, a larger memory limit, and much better graphics. So if
you're curious about Gemulator, now is the time to ask me. Gemulator
3.0 goes on sale in about 2 weeks and will also be shown and sold at
the Glendale show next month.

After this CO you can also download file #29642 with more information,
or write to us at:

Branch Always Software
14150 NE 20th St. #302
Bellevue, WA 98007
```

to receive a newsletter with Gemulator 3.0 info. But everybody feel free to ask me questions about it now!

<[Host] BRIAN.H> First question, Darek, PMC is not the sole distributor for your product anymore? Who should dealers contact?

<BRASOFT> PMC handled most North American distribution of Gemulator for the 11 months it has been on the market so far. But I've just recently picked up additional dealers like Toad Computers, Rising Star, Floppy Wizard, Xanth, and others who will all be carrying Gemulator 3.0. Dealers interested in carrying should contact me directly now. Until the Glendale show (one month from today) most of the dealers I just mentioned will have an introductory price on Gemulator 3.0 for $199 (including TOS 2.06 ROMs).

<[Host] BRIAN.H> What are you doing to get other developers to have their products GEMULATOR compatible?

<BRASOFT> Last summer and again this summer I'm doing a product swap with many Atari ST developers. I give them a Gemulator and they give me the latest copies of their software. This has been one way that Gemulator's compatibility has been made very high. About 20 developers, including DMC, Gribnif, Codehead, Fair Dinkum, Dave Beckemeyer and others have participated in this. By Glendale I will have a newer compatibility list of software. The one I uploaded has about 70 programs listed currently, but that is by far not a complete list of compatible ST software.

<[Host] BRIAN.H> Thanks Darek! Up next to the podium is Doug Hodson. GO Doug!

<D.HODSON> Is GEMULATOR compat with DOS 6.0 and Double Space?

<BRASOFT> Yes on DOS 6 and yes on Double Space. You can store ST files on a double spaced or "stacked" drive. You can't perform direct sector I/O to a stacked drive, but almost no ST software does this anyway.

<[Host] BRIAN.H> Next in line to the mike is T.Jones. Come on down and ask away!

<T.JONES21> How much hard disk space does Gemulator 3.0 require? And how about ICD drivers (your press release only mentions SUPRA and HDX)?

<BRASOFT> Gemulator requires 1.3 meg of hard disk space, plus any hard disk space you use to store your ST files of course. Gemulator can access your C: D: E: and F: hard disk partitions giving you total online storage of up to 128 meg. The press release mentioned the Supra and HDX drives. I just haven't recently tested with the Supra driver, so that's why I didn't include it. Any driver, whether Supra or HDX will work equally fine.

<[Host] BRIAN.H> Nice question. Ok, up next is Tim.

<[Tim@TWP] P-DIRECT2> I was just wondering... does ANSITerm work on the Gemulator? It does quite a number of 'illegal' things, but it works just fine on the Falcon, amazingly enough.

<BRASOFT> I've never tried ANSITerm so I can't say for sure, but I can verify that Flash, Interlink, Stealth, and the VT52 emulator accessory all do work right up to 9600 baud. It doesn't matter that a program does "illegal" thing. Gemulator emulates the ST hardware, it is not just a TOS emulator. So you can run programs that access hardware directly, or write to screen memory directly etc. Gemulator takes those "hardware peeks and pokes" and converts them to real hardware accesses on your PC. A lot of programs might not run on the Falcon due to hardware differences and differences between the 68000 and 68030. But Gemulator emulates the 68000 chip giving you maximum compatibility.

<[Tim@TWP] P-DIRECT2> Thanks.

<[Host] BRIAN.H> Next in line to the mike is Ed from Vancouver, CANADA. Come on down and ask away Ed!

<[Ed] E.MUI> Does Gemulator require any special partition of it's own or can you use the IBM hd just as if it was an ST hd? Also the max baud rate is 9600? Why can't it go faster?

<BRASOFT> Gemulator _does_ not require its own partition. Since MS-DOS and GEMDOS format disks the same way, you can freely put ST files on any ST floppy or hard disk partition smaller than 32 megabytes. Beyond 32 megabyte partitions, MS-DOS and GEMDOS do use different formats, so Gemulator provides a feature called "virtual partitions" to allow you to use 32 megabytes of any hard disk partition, large or small. Thus the 128 megabytes of possible storage: 4 partitions * 32 meg = 128. As for the baud rate, how much higher would you like to go? 19200 is about the standard max on PCs.

<[Ed] E.MUI> Recently I've heard about Geneva, will that work as well on the Gemulator?

<BRASOFT> Yes, Gribnif is one of the developers that provided us with their software. I have the Geneva beta up and running no problem. In the Gemulator newsletter you'll see a screen dump of Geneva.

<[Ed] E.MUI> May I get a copy of the newsletter?

<BRASOFT> Sure. After the CO just email me your mailing address.

<[Ed] E.MUI> Ok, thanks a lot and I can't wait to see the Gemulator.

<[Host] BRIAN.H> Thanks Ed. I liked those questions! Next we have the honour of having Charles Smeton to ask a thought provoking question or two. Please speak Charles!

<C.S.SMETON> Darek, you just sort of touched on my question. FAX operation requires 19200 baud. This is a hardware thing that can't be changed in the FAX Modem.

<BRASOFT> I've personally tested XMODEM transfers at 9600 baud. 19200 is definitely possible on a PC, and I'll need to test that out with a null modem cable since I don't have a 19200 baud modem. So don't take the fact that I said "300-9600" as meaning it won't do 19200, I just haven't tried it. I'll let you know in a few days when I get a chance to do that.

<[Host] BRIAN.H> Go again Charles!

<C.S.SMETON> The PC BIOS supports 9600 directly, 19200 requires some hardware fiddling... Any V.42bis type of Modem should auto baud up to 19200, even a 2400 with V.42bis..

<BRASOFT> Hardware fiddling is what Gemulator does. <grin> We should talk about a product swap.

<C.S.SMETON> Sounds good.I have another question... Any chance of a Hybrid between a Gemulator and Spectre ?

<BRASOFT> Dave Small and I had a long discussion about that at the Glendale show last year. Apparently he decided against it and as you may have seen has been posting messages on the Gemulator topic here on GEnie making sure SPectre doesn't even RUN on Gemulator. I don't know why Dave would want to prevent his customers from running Spectre, but I am abiding by his wishes and Gemulator is crippled in the sense that you cannot run Spectre on it. I do allow you to run other Mac emulators like Magic Sac, and Dave hasn't had a cow about that.

<C.S.SMETON> OK, one last question... How about porting NT to the Atari hardware -- that would even out do Gemulator.

<[Host] BRIAN.H> hehe. Comment Darek?

<BRASOFT> I guess. For what purpose though? A PC is cheaper than an ST, so if you need an NT platform, it's cheaper to just use a PC.

<[Host] BRIAN.H> Thanks Charles. Me again. This goes along with Charles hybrid question. Are there any other products planned for BAS? What about Amiga emulation? What about your own MAC emulator?

<BRASOFT> If you've been reading the previous newsletters, you will know that I am working on an emulator for the PC to emulate something other than an ST. That's still in the works but not ready for prime time, so that's all I'll say for now. Maybe at next year's Glendale show (probably sooner) I"ll have a working product to demo.

<[Host] BRIAN.H> Thanks Darek. Up again is T.Jones. Go!

<T.JONES21> Your press release states that there are 8 ROM sockets on the card. Are these in addition to the sockets used by the included TOS 2.06 ROMs?

<BRASOFT> 8 ROM sockets on each card. TOS 2.06 occupies 2 of those, leaving 6 more sockets free for other ROMs. This can be a 6-chip set of TOS 1.0, TOS 1.2, or TOS 1.4, or 3 2-chip sets. You can also plug

in up to 4 Gemulator cards into your PC for a total of 32 ROM sockets. Gemulator will detect them automatically and give you a menu of ROMs that it detected. Then you simply pick from the menu and it boots up using that TOS version. This allows you to VERY easily switch from running TOS 2.06 to some other version for software that doesn't' run on TOS 2.06.

<T.JONES21> Wow! That's really versatility! With the Gemulator currently running on Intel hardware, are you giving any thought to a version which will run on the upcoming PowerPC RISC chip?

<BRASOFT> That all depends on whether PowerPC machines will have similar slots to regular PCs. From what I just read in this month's issue of BYTE, it's looking like the PowerPC will emulate the 486 and so I can envision a PowerPC based PC that has regular PC style slots and offers full 486 compatibility. But that's up to Apple and IBM and Motorola to decide.

<[Host] BRIAN.H> anymore T.J.?

<T.JONES21> Also, are you going to do 68030 TOS code emulation?

<BRASOFT> At the moment probably not. There isn't really any 68030 specific software out there, and the 68030 TOS (like TOS 3.06 or TOS 4.02) doesn't really provide anything that you don't get using TOS 2.06 and MultiTOS/Geneva. (actually, if you want 3-D dialog boxes like on the Falcon, just use Geneva on your ST)

<T.JONES21> Thanks for all the good information. I'm excited about the Gemulator and I don't even have a PC but I'm going to go see TOAD tomorrow!

<BRASOFT> Good. Toad does have a beta of Gemulator 3.0 that you may be able to look at. They'll have the real product in about 2 weeks.

<[Host] BRIAN.H> Thanks. You even asked questions that other in the line were going to ask! Thus real good questions [grin]. Up next is Doug Hodson again. Go Doug!

<D.HODSON> Does the Gemulator support higher resolutions than a standard ST?

<BRASOFT> Yes. Because the PC's VGA card supports 640x480 color graphics standard, Gemulator lets you take advantage of that. So in addition to 320x200, 640x200, and 640x400, Gemulator lets you do 640x480 in color and monochrome. IF you have a VESA compatible SuperVGA card, you can also do 800x600 mono and color. That's twice the resolution of regular ST monochrome and 7 times the resolution of ST 16 color mode. It makes for really kick butt desktop publishing, and is fully supported by Pagestream and Calamus SL. Most other GEM based software also supports 800x600.

<D.HODSON> Thats all, thanks.

<[Host] BRIAN.H> What is your vision of the future of Atari ST(E)/ Falcon? Can it be a positive future? I know I hope it is. You must have hope in it to sell an ATARI emulator

<BRASOFT> Well certainly there are still a lot of developers out there putting out some very nice software. That's why I'm working with developers to make sure their software can be certified as Gemulator compatible. But Gemulator on a PC is an Atari ST clone, so I am competing with Atari in the area of hardware. You can buy an ST, or an STE, or Mega ST, or TT, or a Falcon, or a "gemulated" PC. It's just another hardware platform. Since we are up to almost 600 Gemulator users already, I believe this already exceeds the number of Falcons out there and is catching up closely to the number of TTs. So in the future I would hope that people will treat a PC with Gemulator as just another model of the Atari ST.

With such wide availability of PCs and their cheaper and cheaper prices, it's an economically good decision to buy an ST clone. And the more of these there are out there, the larger a market Atari developers will have to sell to. Atari themselves have not done such a great job of expanding the market and is on their way to choking their own market by never having machines ready or available. So, the future for Atari the company may not be so bright (has it ever been) but that's no reason people can't be using Atari software 10 or 20 years from now on a PC.

<[Host] BRIAN.H> I would like to know what changes are planned for the future for GEMULATOR? I know you are just releasing version 3.0, however I am really interested in its future. You mention a few thing already but what else?

<BRASOFT> Well, as I add more and more features that emulate more chips and ports of the ST, it raises the compatibility of Gemulator. Right now the big gaps are joystick port support and MIDI port support. You'll probably see those in a future release. I'm also always working on speeding up the emulator and improving its limits. Already it double's the ST's 4 meg RAM limit to 8 (EIGHT), doubles the floppy disk capacity to 1.44 meg, double the screen resolution, but those can all be pushed more. 1024x768 is something I'd like to support in the future, especially if people start writing more and more software for the Falcon's and TT's higher graphics modes. So those are a few things. But a lot of features I add to Gemulator are as a result of existing Gemulator users giving me suggestions or ideas to improve it, so who knows. As an example, people hated the fact that when you ran Gemulator 2.1 you had to always specify the TOS version and the amount of ST RAM you'd like to emulate. So I automated that in the form of an INI file and preset settings. You can now literally turn on your PC and a minute later have the Atari ST desktop (or an program) running on the screen without any typing on your part. So it's like turning on a real ST!

<[Host] BRIAN.H> Thanks. Ok, Offy will take his turn at questioning Darek about GEMulator. Go Offy!

<OFFY> How do you use things like Spectre GCR, digitizers, and scanner carts?

<BRASOFT> You don't. As I explained Gemulator specifically prevents you from running Sprectre as per the wishes of Dave Small. But other than cartridge ROMs, you can't plug in non-ROM cartridges like digitizers. That could be a possibility for a future version but would require additions to the card. Possibly a higher priced version of Gemulator.

<OFFY> Ok. In realistic figures, what PC is required to emulate my Mega STE in 16Mhz/cache mode, cycle for cycle?

<BRASOFT> The emulation works such that for every 3 clock cycles of the 486 you emulate 1 clock cycles of the ST. So to emulate an 8 Mhz ST, you need a 25 Mhz 486 or 486SX. To emulate a 16 Mhz Mega STE you need a 50 Mhz 486. The 3:1 ratio is a good rule of thumb. On the 386, which is a slower chip, it is a 5:1 ratio. So a 40 Mhz 386 is roughly equivalent to a 25 Mhz 486SX, meaning it emulates roughly an 8 Mhz ST.

<OFFY> Finally, how are you handling the sound of a normal ST or STE? Do you utilize the Soundblasters, etc to at least provide the true sound of the ST machines?

<BRASOFT> Yes, actually any AdLib compatible card (and the Sound Blaster is a clone of the AdLib) will work. Gemulator emulates the 3 voices of sound of the ST and Mega ST. It does not emulate the stereo sound of the STE, but that's a possibility on the Sound Blaster Pro for a future version. Let me just add that when buying Gemulator, a lot of ST dealers now also sell PCs and will even allow you to trade in an ST for a PC. Those of you who read ST Informer have probably seen the ads from Rising Star about that. Last I heard, they sell a 33 Mhz 486 with Gemulator and a 200 meg drive for about $1500, less if you trade in an ST. So check around, keep the 3:1 and 5:1 formulas in your head and buy yourself a good system.

<[Host] BRIAN.H> OK, Offy, anymore?

<OFFY> What feedback do you get from ST or STE owners that have switched to PC and purchased a GEMulator to get back to the feel of a real computer? Do they miss the features that you are still working on implementing? MIDI, stereo sound, etc?

<[Host] BRIAN.H> good question!

<BRASOFT> Joystick support and MIDI are the big ones. I know last year at the Glendale show there were a lot of musicians interested and asking about MIDI, but at the time there were more urgent issues like improving the hard disk support and graphics. Not many requests for stereo sound yet, but if more really cool stereo sound programs come out then that's a possibility. It's surprising, but a lot of Gemulator users buy it to run some specific program. Perhaps they keep all their records in a specific database, or do all their desktop publishing in Calamus and don't want to start from scratch when they buy a PC. I

myself use Gemulator all the time when I'm on the modem because for 6 years I've used FLASH and have yet to find anything half as decent on the PC. I"m doing this RTC right now in FLASH and can't imagine doing it in WinTerm or Procomm or anything like that. That's one of the reasons I added modem support. <grin>

<[Host] BRIAN.H> Up next is DMJ owner and operator, Damien (Splat!). Go Damien!

<[Splat!] DMJ> I just joined the conference, Darek, so if I ask something that's already been covered, please forgive me. <g> What's the GEMulator's current compatibility with GEM programs?

<BRASOFT> Glad you could join us Damien. Not including software that uses MIDI ports or the joystick or is timing dependent (typically copy protection schemes), Gemulator should run 100% of your GEM programs, whether they use "legal" TOS/GEM calls or whether they access hardware directly. Talk to me later about the product swap deal I have for developers like yourself.

<[Host] BRIAN.H> anymore Damien?

<[Splat!] DMJ> More questions in a bit, but for now, I assume anything that writes directly to the video hardware wouldn't run too well.

<BRASOFT> no, no, that's not what I said. It's perfectly ok for a program to write to video hardware. Gemulator DOES NOT emulate TOS. It just runs the TOS ROMs as straight 68000 code, just like any other program. It traps all accesses to hardware and converts them to PC hardware references. So you can peek and poke to screen memory, to the hard disk controller, sound chip, whatever. Gemulator takes care of all that.

<[Splat!] DMJ> After doing some Windows programming myself, I've gained a new appreciation for TOS and I can imagine how much trouble GEMulator must have been to put together. About how much does the card & software cost?

<BRASOFT> First, Gemulator is not a Windows specific program, so you can run it just fine from DOS. The card with emulation software and TOS 2.06 ROMs has a list price of $229 although the street price is $199 at most of the mail order Atari dealers. See file #29642 in the ST library for a list of dealers.

<[Splat!] DMJ> Thanks, that's all for now... but if I get a chance I've got a few more, for later.

<BRASOFT> Ask now. The RTC will be over soon!

<[Splat!] DMJ> There's more people waiting to ask questions, I don't want to shut them out.

<[Host] BRIAN.H> up next is Doug from ... Rising Star. Go Doug.

<D.HODSON> How long before MIDI support?

<BRASOFT> Whenever I get to it. I don't know when the next Gemulator after Gemulator 3.0 will be, and I don't like to set expectations by giving dates. That's Atari's practise, and it's bad. I have released 4 versions of Gemulator in 11 months, so probably not too long into the future.

<[Host] BRIAN.H> anymore Doug?

<D.HODSON> Understand, just was thinking of a PC/ST portables.

<[Host] BRIAN.H> Have the planned audience for your product been smaller or larger than expected? Also, has BRANCH ALWAYS SOFTWARE been a success in your opinion? That is, Darek did you believe you would be where you are today? (The two questions tie together.)

<BRASOFT> Well, the potential audience is each and every single Atari ST user out there. 600 is obviously not all of them. <grin> But about 18 months ago when I first started demoing Gemulator at shows, I figured I'd do well if I sold 100 units. All of the original pricing was based on the cost manufacturing and shipping 100 Gemulator boards. That's why originally I was talking about a $300 or $400 emulator. But as you know, the more hardware you make the cheaper it gets, and when over 200 advance orders for Gemulator came in before it even shipped, I knew that was a good sign! 600 is more than I expected by this point, and with all the new dealers signing on to sell it, I have no doubt it will sell thousands of units over the next few years. That definitely makes me happy! <grin> I have no regrets about what I did 18 months ago, which was to sell off the Quick ST product to Codehead. Codehead has made some nice improvements to it and at $229 instead of $24.95, I can't complain about the profit margin on Gemulator either. <grin>

<[Host] BRIAN.H> Glad to hear it Darek! If it helps ATARI developers, it helps all of us. Last question of the night, Darek, what is the upgrade policy for owners of older versions of GEMULATOR?

<BRASOFT> It's a very inexpensive upgrade. $30 from any earlier version if you upgrade by September 3. By that date we'll already start shipping the product to dealers and be shipping the upgrades. After September 3 the upgrade cost will be $60 and you may have to wait as I"ll be headed for Glendale. So the sooner you upgrade the sooner you get to use 800x600 graphics, sound, modem, and all the other new cool features!

<[Host] BRIAN.H> We're drawing to a close for the formal portion of the BRANCH ALWAYS SOFTWARE RTC. Before I put the room into Frenzy Mode, do you have any closing words, Darek?

<BRASOFT> Well, I just want to thank everyone for coming! Email me if you have any questions. Don't be afraid to ask. Thanks.

<[Host] BRIAN.H> I wish to thank you Darek for making it here tonight.
I also wish to thank all the attendees for their questions and
patience. In frenzy mode ...now!

End of Formal RTC

****

Be sure to stop by on Wednesday, Aug. 25th for our next RTC with Bob
Luneski of Oregon Research Associates. Bob will discuss the exciting
new disk doubler DATAlite. Setting a new standard for transparent real
time disk compression on the Atari, be sure to attend for the chance
to take one home as a DOOR PRIZE! For more information, type "ST" and
go to CATegory 33, TOPic 16. Your host will be Brian Harvey. See you
then.

3043. Wanted: Window-using Gnuplot port

Newsgroup: comp.sys.atari.st
Date: 1993-08-23 18:11:34 UTC

Hi folks,

is there a port of Gnuplot that uses GEM windows (as opposed to the
whole screen) for screen output? The current port (sorry, I don't have
the version number handy) clears the entire screen and plots on it,
which tends to be a bit of a problem with MultiTOS.

Oh -- I'd like to ask the same question for GhostScript.

Greetinx & thanx in advance, Jan

} No, that's not Clive Sinclair; I'm refering to Peter Day-Sinclair,
} who hit an all-time high for offending as many people as possible
} by a triple re-posting of ca. 200 line message with no new remarks
} (not that anyone wants to read his drivel). Once several people
} complained about having to pay download fees for newsgroups, the
} epitome of clueless morons discovered he could strike at Atari
} owners wallets, and has had the bad taste to do so.
}
} By all means, send mail to his postmaster, or you could try
} root as well; mail to sinclap2954@cobra.uni.edu does little
} good.

I seriously considered setting up an account on one of our machines
that doesn't do very much, and using crond to mail him something
like /usr/dict/words every 2 minutes... I didn't, because I'm a
"nice" (hah!) person. He's a real pain inthe ar*e though.

Simon.

AHA! When Mom got the old 1040STf, Geneology was her top priority! It just so happens that I can help you!

We experimented with the demo availble from BRE software for the program from Flying Pigs--drat, can't recall the name. It was a nightmare, and the developer wouldn't answer Mom's phone calls---SO...

We went to Compute Your Roots--bought it from Toad computers, but is probably availible elsewhere. Mom had loved the 8-bit version, she loves the ST version, which works in color or monochrome, is easy to learn, and was written by a friendly and decent individual who HAS answered Mom's question. It prints geneology charts, allows the insertion of lengthy ASCII notes, and processes linkages in a variety of different ways. Trust me, also--Mom has really tested the thing. LDS fields optional, you'll know what that means if you want that.

Good hunting!

In article <afonseca.0bjo@terapin.com> afonseca@terapin.com (Alberto Fonseca) writes:
>Hmm.. Very intersesting message here.. It really got me thinking.. I own an
>ATARI 1040 STE, and am selling it to upgrade to a much bigger/better computer.
>The truth is, I guess I could keep this system and do what I need to do with
>it, but I want more for myself.. I want a powerfull computer with the ability
>to multi-task, and that has alot of great software to explore.
>

I know what you are on about. The problem is, as far as I can see, that
mega-machineitus is completely incurable. I have a problem with it myself.

I mean, for word processing there was a time when a 48K Atari 800 would do,
or a 16K spectrum. *sigh* no more. These days a 640K 286 isn't good enough
for the job. It is *silly* but people actually seems to believe they really
cannot do anything without oodles of memory and more MHz than fingers.

I blame marketing. Nothing feeds the "I want" troupe like marketing.

But then I see marketing as the ultimate distorter, making features out of
kludges, and hammering good products because they lack glamour.

>I naturaly am thinking of the Falcon 030. Its close to my STE in terms of the
>OS, and allows multi-tasking, etc..

Ohhhh, so am I, so am I. Gimme gimme gimme:)

>But I would love to be compatible with the
>"industry standard".. Being able to say, yes I have Word Perfect at home.. Or

Ohh, so would I. But is it that important. I use LaTeX as my one and only
text processor and I *love* it. It doesn't sparkle, it doesn't shine and
it is not user friendly, but I am very fast with it and I have complete control,
and I can mail the source file anywhere in the world and the output can
recompiled from that.

You only need *one* good text processor.

>being able to go to almost any store and browse through a library of software,
>with many new titles. I can either get a Falcon 030, or an IBM 486. Of course
>the 486 would be alot faster, more powerfull, offer better graphics, same
>sound.. I don't know if there would be very much of a price difference either..
>And I would instantly know ALOT of people that I could talk to about computers
>without them saying, "ATARI makes computers?", and being able to share files..
>If I got a Falcon030, I would have a computer I feel more confortable with,
>always having used ATARI's from 8-bit to STE, and being different from the
>rest. But there isn't much software, and no security.
>

This is my problem too. I have money to spend (indeed it is burning a hole in my pocket) and I want a computer. The problem is I have a sun 3/50 that does for my comms and word processing but I keep thinking it is a waste of space because it does not *inspire* me. my flatemate has a 486DX2-50MH which bores me silly and for the life of me the Amiga just leaves me cold (It has the i/o abilities of a potato, but without the looks:)). Lets face it, for the work I do the set up is almost perfect. Why do I need another machine.

I want to be inspired, I want to create, I want options. No other machine sparks my interest like the Falcon. I mean that.
